15 P R O C E E D I N G S

16
17 COURT SECURITY OFFICER: All rise.

18 (Jury in.)

19 THE COURT: Please be seated.

20 You may continue your direct examination.

21 MR. HARDIN: Thank you, Your Honor.

22 Q. (By Mr. Hardin) Mr. Sheehan, when we took our
23 lunch break, we had just finished going over how the 3ml
24 Integra product fits the descriptions of Claims 10 and
25 25 of the '077 patent.

1 A. That's correct.

2 Q. Okay. We've prepared a summary slide on that
3 to summarize your opinions on the '077 patent and how
4 it -- how its definitions include within its scope all
5 the features of the -- necessary features that are
6 required to infringe it that are found in the 3mL
7 Integra.

8 A. Yes, sir.

9 Q. Okay. So on the '077 patent, what's this
10 first drawing over here to the left?

11 A. Okay. This is actually a showing of two
12 things. You can see tucking occurring, and you can see
13 venting. I believe the vents are in that as well.
14 Yes.

15 Q. Is this -- is this a figure from the patents
16 that the jurors can find?

17 A. Oh, yes. This is Figure 12.

18 In all three patents, the figures have the
19 same numbers. They are the same figures. So you can
20 look at any of the patents. This is from the '077, but
21 Figure 12 will be the same.

22 And there you can see the drawing by Mr. Shaw
23 showing the tucking and also the venting flowing up
24 through -- it looks like the '168 patent is what it is.
25 Yeah.

1 Q. So behind Tab 2 in the juror notebooks, they
2 can turn to Figure 12 and they'll see this drawing?

3 A. That is correct.

4 Q. And, again, the drawing relates to the claim
5 language how again, please?

6 A. If you remember, in Claim 10 -- Claim 10 is
7 about a tuck and vent -- here you see a series of vents.
8 These go all the way around. There's a number of them.
9 Four is shown, essentially, implied in the drawing. And
10 that's where the air vents out safely from the back end.
11 And then by the same token, you see right here
12 (indicates) that the tip of the plunger, the finger
13 press is down inside in close association or locked
14 inside the collar. And so you can't easily grasp it.

15 Q. All right.

16 MR. HARDIN: Can we see the next portion
17 of this slide?

18 Q. (By Mr. Hardin) And this is a picture of the
19 3mL Integra product?

20 A. That is correct. This is the accused device
21 in the case of the '077 patent, Claims 10 and 25, is the
22 BD Integra 3mL syringe.

23 Q. The next portion of this slide. This is the
24 little animation that you showed where --

25 A. Right. This is the same one just a little

1 harder to see, but -- but you can see the venting
2 occurring. And also, here is that little snippet from a
3 BD drawing, actually from Becton Dickinson, showing the
4 exact same feature that's shown here in the patent.

5 Q. And so does this device infringe Claims 10 and
6 25 of the '077 patent, this device being the 3mL
7 Integra?

8 A. Yes. The 3mL Integra literally infringes
9 Claims 10 and 25 of the '077 patent.

10 Q. All right. Let's move forward, then, on to
11 our next patent and the claims that we're asserting,
12 which we're going to take up the '224 patent.

13 MS. PIROZZOLO: Your Honor, may we
14 approach?

15 THE COURT: Yes.

16 (Bench conference.)

17 MS. PIROZZOLO: In Mr. Sheehan's expert
18 report submitted in this case, he never rendered an
19 opinion on beliefs of frictional holding force in the
20 3ml syringe. And I want to get an instruction that he
21 should not be allowed to testify about release of any
22 frictional holding force in the syringe.

23 THE COURT: Mr. Hardin, obviously, I
24 don't know whether you did or didn't.

25 MR. HARDIN: I don't --

1 MS. PIROZZOLO: And I have the paragraph
2 tabbed, and I can even show you he did say something --
3 he did mention the word friction with regard to the 1ml,
4 but he never mentioned the word frictional release with
5 regard to the 3ml.

6 That's the 1ml. That's the 3ml
7 (indicates).

8 MR. HARDIN: Here's what he said, Your
9 Honor: The inner plunger rod moves forward further
10 allowing the cutter to cut or break through the plunger
11 stopper and separate the continuous retaining member
12 from the needle-holding portion of the retraction
13 mechanism by cutting or breaking the thin portion,
14 separating cutting.

15 The word release isn't there, Your Honor,
16 but I would submit that --

17 THE COURT: In his deposition, was this
18 covered by way of deposition?

19 MS. PIROZZOLO: No.

20 MR. HARDIN: Well, the point -- the point
21 is that the method -- I mean, this is really -- the fact
22 that the word release doesn't -- doesn't -- doesn't
23 appear here, Your Honor, it is a description of
24 precisely how that device cuts and separates and
25 releases the device.

1 THE COURT: I'll allow you to refer
2 to the -- do you want to make a comment?

3 MS. PIROZZOLO: I do. I do, Your Honor.
4 Judge, I think this is highly prejudicial to us given
5 your claim construction modification, because you said
6 there has to be release. And that was something that
7 agrees with, Your Honor.

8 MR. HARDIN: That was after this report
9 was written.

10 MS. PIROZZOLO: But there was no
11 amendment. There was no addition to the report, and it
12 should not happen here for the first time.

13 I want to show you what he said about the
14 1ml syringe just to show you that when release of
15 frictional holding force occurred, it was quite
16 explicitly mentioned with regard to the 1ml syringe.

17 MR. HARDIN: Well, of course, the word --

18 MS. PIROZZOLO: That does not appear in
19 the 3ml.

20 MR. HARDIN: Your Honor, the word release
21 occurs here. The word separate occurs in the other
22 report.

23 I mean, the witness -- again, Your Honor
24 put this restriction into the claim after these reports
25 were already there. So it fit the definitions at the

1 time.

2 Your Honor then made that slight
3 addition. But the reason I readily agreed to it, not
4 that Your Honor will remember, I said that's fine, was
5 because I clearly believe that separating and the
6 releasing were the same thing in this case, the release
7 or separation.

8 MS. PIROZZOLO: Your Honor, it's
9 cutting -- cutting the needle holder does not release
10 the friction between the barrel and wall.

11 THE COURT: Let's go back to the language
12 concerning this claim.

13 MR. HARDIN: The inner plunger rod moves
14 forward allowing the cutter to cut or break through the
15 plunger stopper and separate the continuous retaining
16 member from holding portion of the retractor by cutting
17 or breaking the pen-bridging portion extending between
18 them.

19 That's the point, it breaks the bridge
20 and releases.

21 I'm sorry. Your Honor, the fact issue in
22 this case is whether that cutting or breaking
23 releases --

24 THE COURT: I'm going to let him testify
25 to the language of that report.

1 MR. HARDIN: Okay.

2 THE COURT: He can give an opinion
3 whether that satisfies the claim.

4 MR. HARDIN: Okay.

5 MS. PIROZZOLO: Just to be clear, that
6 means he cannot mention the word friction with regard to
7 the 3ml syringe?

8 MR. HARDIN: Your Honor, that's what
9 holds it. That's not at all --

10 THE COURT: I'm going to allow him to
11 then ask does he feel that satisfies the claim language.

12 MS. PIROZZOLO: But he can't use the word
13 friction?

14 MR. HARDIN: Yeah. That's my -- that's
15 not --

16 THE COURT: I'm going to allow him to use
17 the word friction. I think the report gives fair notice
18 of this.

19 MS. PIROZZOLO: We disagree, Your Honor.

20 THE COURT: Okay. I understand. Note
21 your objection.

22 MR. HARDIN: Thank you, Your Honor.

23 (Bench conference concluded.)

24 Q. (By Mr. Hardin) All right. Mr. Sheehan, we
25 are going to move to the '224 patent.

1 And with respect to this patent, does this
2 patent -- does this patent have claims that are asserted
3 against both Integra products, both the 1ml and the 3ml?

4 A. That's correct.

5 Q. Okay. So first, we're going to go to
6 Claim 43, which would be at the end of these numbered
7 paragraphs at the end of the patent.

8 A. Column 22?

9 Q. And it goes all the way over into Column 23.
10 Am I correct?

11 A. Starts at Line 35 in Column 43 on the right
12 side of the page.

13 Q. Okay. Now, in order to assist the jury in
14 doing what they're going to have to do at the end of
15 this case, which is to decide whether the 3ml -- we're
16 going to go through this -- first of all, sort of a
17 warning in advance -- we're going to go through this
18 claim twice, aren't we?

19 A. Yes, we are, because the 3ml and the 1ml both
20 infringe.

21 Q. Okay. And our burden is to demonstrate to the
22 jury that both in the structures of the 3ml and the 1ml
23 Integra products are different?

24 A. Yes, there are differences between them.

25 Q. And your opinion is you studied both those

1 structures, and both those structures -- both those
2 products infringe this one claim?

3 A. That's correct.

4 Q. So that requires us to go through the claim
5 twice, once for the 3ml and once for the 1ml?

6 A. Yes. I'm afraid we have to go through it
7 twice.

8 Q. Okay. All right. So we're going to begin
9 with the comparison of the 3ml product to this Claim 43.

10 A. Yes, sir.

11 Q. Okay. And you've prepared a chart like we did
12 for the other patent.

13 A. Yes. And charts and diagrams and stills and
14 documents.

15 Q. Okay. Very good.

16 So what's the first -- what's the lead-in or
17 the preamble in this claim?

18 A. Just -- inadvertently, that was good. This is
19 actually two pages' worth of limitations. So be
20 prepared for two pages. They just showed the second
21 page.

22 There it is. That's the second page.

23 So this will be a little longer.

24 But going to the first one, the first
25 limitation really is not a limitation; it's the

1 preamble. And it says: A syringe assembly having a
2 retractable needle that is rendered unusable after a
3 single injection, da-da-da, comprising. That's the
4 preamble; it's not a limitation. Just tells you what
5 it's about.

6 And, of course, that's met.

7 So we can go to B, which is the first true
8 limitation, and that is a hollow syringe body comprising
9 a barrel having a front-end and a back-end portion.
10 Straightforward.

11 We've seen this picture before. Here is the
12 3mL BD Integra; here's the back-end portion; here's the
13 front-end portion (indicates).

14 This limitation is satisfied. Gets a
15 checkmark.

16 C: The back-end portion, the one we just
17 mentioned, provides at least one radially extending
18 member being a finger grip. Well, there they are.
19 There are the finger grips right here at the back-end
20 portion. Straightforward. Same sort of picture.
21 Checkmark there.

22 D: A retraction mechanism disposed in the
23 front-end portion. Now, here we're going to see the
24 retraction -- oh, by the way, dispose is one of those
25 patent words. It just means located in.

1 It's disposed in a vestibule, or it's disposed
2 in the front end or whatever. It just means it's
3 located there.

4 So the retraction mechanism is disposed in the
5 front-end portion. This is that green part. Remember
6 the rest of the part, the other part of the barrel, goes
7 back off to the left.

8 And now when the animation is run, you will
9 see the retraction mechanism be disposed in the
10 front-end portion. There's the screen going in.
11 There's the needle holder. There's the retainer member,
12 the non-retractable part, bridging portion. And then
13 the needle is put in, of course, from this side, because
14 that's the only way you can do it from the manufacturing
15 standpoint.

16 Q. So -- so -- so you know all about this, and
17 you've done it several times?

18 A. Yes.

19 Q. But that was a lot of information really
20 quickly.

21 A. Sorry.

22 Q. So in this 3mL Integra, does this slide -- was
23 this slide created from the drawings of the BD product,
24 the actual little plastic pieces?

25 A. These? This animation was made using the

1 drawings, the engineering drawings, supplied to -- to
2 RTI by Becton Dickinson in connection with this lawsuit.
3 So these are accurate representations of the actual BD
4 3mL Integra product.

5 Q. And -- and what we're seeing here again, we
6 see how many pieces, just so -- I think they are
7 color-coded, but to be sure, I want to understand what
8 we're seeing.

9 A. Okay. The green, which is the front-end
10 portion, it's part of the barrel. And the rest of the
11 barrel is back out here (indicates).

12 The red is the elongated needle holder, and
13 here's the fluid path going through it. And finally,
14 this silvery part, well, that's the needle. And, of
15 course, the pointy parts are over here. And this is
16 glued in, as is tradition, into the elongated needle
17 holder.

18 Q. But you used the word glue. I want to make
19 sure we understand, because there's going to be a lot of
20 questions about where there's -- there could be a
21 question about where there's glue, where there's
22 friction, or clamping.

23 So where is the only glue seen in this
24 picture?

25 A. Oh, the only glue you see is in this dark area

1 here. And, unfortunately, it goes underneath the
2 spring. And you can kind of see where the needle comes
3 to an end. So the glue fills up that area there.
4 You can see the glue at the tip of any one of these
5 syringes. It's kind of small, but that's where the glue
6 is.

7 Q. So in the sense of how the needle -- we're
8 using the term needle holder a lot, okay? So I don't
9 want anybody to have any confusion.

10 The way the needle is held in that little
11 piece of plastic, the red plastic, is by glue.

12 A. Correct. Or technically, we call it adhesive,
13 but, generally speaking, it's glued in.

14 Q. And in the terms of the patent, that elongated
15 red piece of plastic, that's what you're terming a
16 needle holder?

17 A. Correct, all the way out to here. This whole
18 thing is the elongated needle holder. This is the
19 little head end on it. Steps down so the spring has
20 something to push on. And then the spring pushes off
21 this end of the front end of the barrel, and then will
22 eventually push that back.

23 So the bottom line, this is the retraction
24 mechanism. And where is it disposed? It's disposed in
25 the green part, which is the front-end portion.

1 Q. Of the --

2 A. Integra 3mL.

3 Q. Now, next limitation after that -- so E would
4 get a checkmark?

5 A. Actually, D got a checkmark.

6 Q. I see.

7 A. And actually, I kind of jumped ahead a little
8 bit, because Limitation E describes some of the details
9 of -- of the retraction mechanism.

10 Q. Okay. So D just required there be a
11 retraction mechanism, and now we're getting all the
12 adjectives. We're finding out if it's glue or finding
13 out more about the structure.

14 A. Correct. And you had a sneak preview of it.
15 And so what you see here is there's that red part here
16 again, but this is a Becton Dickinson drawing showing
17 the dimensions and all this, an engineering drawing, and
18 we just colored it in.

19 So this is the elongated needle-holding
20 portion that's required, a head portion. You can see
21 the head portion back at the end here. And, of course,
22 there's a fluid path in here that the needle gets stuck
23 into.

24 So anything at the tip of the needle, which is
25 sort of off the screen, would come all the way back into

1 the inside of this syringe.

2 And I believe that covers every limitation you
3 need. Yep. So that can get a green check.

4 Q. Okay.

5 A. F, a little more detail about it, it says:
6 The head portion further comprising an inner head. And
7 now this is the head portion, and now this here
8 (indicates) is the inner head.

9 And -- oh, yeah, here it is pointing to it. A
10 continuous retainer member surrounding, see this and
11 this (indicates)? That's a continuous retainer member;
12 that's the part you'll learn does not retract,
13 surrounding the inner head, and a bridging portion
14 disposed between -- disposed, same thing, located --
15 between the continuous retainer member and the inner
16 head.

17 Now you see this little thing right there,
18 that's a little bridging portion, and that bridges --
19 these are actually gaps here. This -- this is a
20 cross-section of something that's circular.

21 And -- there you go. You can see the gaps
22 here. And this goes all the way around. This circular
23 part is a cross-section. You're looking at half of it.
24 And so it has all of these things. And, of course, it
25 has that fluid passageway again.

1 And so each and every one of these is met,
2 although I think we -- it's a good time to discuss
3 continuous retainer member at some point within the
4 limitation.

5 Q. Okay. Okay. So, again, that last drawing,
6 we're seeing -- this looks like a 3 -- that drawing is
7 an engineering drawing. And by definition, since it's
8 flat, engineers draw it as if we cut a knife right down
9 the center of it.

10 A. Right. If you -- if you take an apple and you
11 cut it in half and you just look at the little white
12 part of the apple, you're looking at a cross-section of
13 it.

14 Q. Okay.

15 A. And that curves away on the paper and comes
16 back out on the bottom.

17 Q. So this -- so just to be sure, so this area
18 right here is really a round flange that goes around the
19 entire --

20 A. Correct. It's a flange, just like on an
21 automotive part.

22 Q. And this right here is actually what you call
23 a bridging portion is actually a thin web or structure
24 that goes all the way around?

25 A. Correct. And connects the retainer member --

1 continuous retainer member to the inner head.

2 Q. Okay. All right. Which is this piece right
3 here, which --

4 A. That's correct?

5 Q. Which itself is, again, round?

6 A. Which itself is, again, round, yes.

7 Q. Which, then, in the needle we saw -- when you
8 were talking about the glue, the needle is slipped in
9 here and this is where the glue would be.

10 A. Yeah, the glue is placed in there to hold the
11 needle in the needle holder.

12 The three-dimensional aspect of this will
13 become evident again when we look at the animation.

14 Q. Okay. So let's do that, look at the
15 animation.

16 A. Now, before we start the animation, here's
17 that red part again. And now you can see that this gap
18 goes all the way around. This flange goes all the way
19 around and comes out here. And you can see the
20 structure is -- it's cylindrical.

21 That's the elongated needle holder. There's
22 your spring. There's the front end of the barrel. This
23 is the back end of the barrel (indicates).

24 And --

25 Q. Excuse me, but we're still looking like we've

1 sliced the apple in half, correct?

2 A. Yeah. We're still looking like we slice the
3 apple in half, except we didn't slice this part in half
4 (indicates).

5 Q. Okay.

6 A. We didn't slice the spring in half, and we
7 didn't slice this part in half. This -- this -- this
8 appears as a solid round cylinder. So it's selectively
9 sliced. Technical people do this all the time in order
10 to show certain features.

11 Sometimes you look at your -- how your car
12 works and you look and you'll see a diagram that kind of
13 looks like this, and you still can't figure it out. But
14 that's the attempt here.

15 Q. Now, let's back up a moment before we leave.
16 How is this being held?

17 A. The way -- and this has to do with the term
18 continuous retainer member. Remember, the Judge
19 construed certain terms.

20 Well, continuous retainer member is -- do you
21 have the tab?

22 Q. Yes. Judge Folsom's definition of what a
23 continuous retainer member is located at Tab 4 of the
24 juror notebook.

25 A. Okay. So --

1 Q. And it's --

2 A. Right. I have it.

3 If you go to Tab 4 -- we've talked about this
4 once before; it's the eighth one down. It's kind of a
5 larger area: Retainer member.

6 And it says: An unretractable part of the
7 retraction mechanism. And that's -- all right. That's
8 this part here (indicates), because that's not going to
9 retract. That flange that Mr. Hardin mentioned,
10 referred to, is a very good term. That flange is not
11 going to retract.

12 That uses some clamping or frictional force to
13 keep the needle in the projecting position.

14 Well, here you see the needle. It's in the
15 projecting position. And what's happening here is this
16 green object is threaded into the blue object, threads
17 down and clamps the red part.

18 This -- this red part normally sets a little
19 bit away from the green part, when it's outside of this
20 assembly. There's a little bit of spring space in
21 there. It kind of bling-blings a little bit.

22 But once you thread this down, it clamps tight
23 now. It clamps the green clamps against the blue,
24 capturing the flange of the -- of what's called the
25 inner hub by BD. And so -- so right there, you have

1 clamping occurring.

2 Now, what will hold that clamping in place is
3 the fact that there are threads here. Now, these are
4 very interesting threads. These are not your typical
5 threads found on the end of syringes used for Luer-Loc
6 connections. That's sort of a standard connection
7 generally not used with a safety syringes.

8 These threads are rather chunky. They are
9 kind of heavy. They are not pointy like a lug nut, a
10 lug bolt, or an erector set thread. They're kind of
11 clunky.

12 And if you look closely at the thread surfaces
13 on the actual Integra 3mL products, those surfaces of
14 the threads have been roughened up. They have a rougher
15 finish than the rest of the barrel, and that can only be
16 for one purpose, which is to increase the amount of
17 friction present in the threading.

18 MR. HARDIN: Your Honor, to illustrate
19 this further, could I ask that the witness be allowed to
20 use the ELMO and show what he's talking about on the
21 ELMO?

22 THE COURT: Yes.

23 MR. HARDIN: Thank you, Your Honor.

24 THE WITNESS: Let's see. How do we do
25 the zoom part?

1 A. Okay. As -- what you can see here -- oh,
2 yeah. Yes, this is coming in backwards, isn't it?
3 Okay. This is the upside down. I have the driver on
4 it.

5 Okay. Pointing to here, you can see the
6 barrel is very clear. You see how shiny it is. Well,
7 that's all nice and smooth and polished. But if you
8 look in the thread area here, what you'll see is it's
9 kind of -- has a patina, has a frost to it.

10 And perhaps if I turn it up this way and then
11 I will bring this up -- it's kind of hard to see, but
12 the inside is frosty on the threads as are the threads.

13 Let me go back down to here.

14 Now, this is the other -- this is the other
15 part of the barrel and the retraction mechanism. And on
16 the blue part that's shaking there, that's all rough as
17 opposed to -- look at -- look at the end. Look -- look
18 up at the top end here, and you see how -- you can see
19 that's -- woe. What happened?

20 We lost our light or the lamp went out.

21 COURTROOM DEPUTY: I think you hit it
22 with your arm right there.

23 MS. PIROZZOLO: Your Honor, may we
24 approach?

25 THE COURT: That's fine.

1 (Bench conference.)

2 MS. PIROZZOLO: I don't know where this
3 is going, but there's nothing about rough or shiny in
4 the expert report.

5 MR. HARDIN: Well, it's friction and
6 clamping, Your Honor, but it's the roughness that -- he
7 says that it's held back for clamping.

8 MS. PIROZZOLO: That's not in his report.
9 It wasn't in his deposition. It's completely --

10 THE COURT: Well, if this is outside his
11 report, I'm going to sustain the objection.

12 MR. HARDIN: Okay. Well, he says it's
13 held by -- the threads are held by friction and
14 clamping. This is an explanation.

15 MS. PIROZZOLO: He didn't say that in his
16 report. He did say something in his definition, but
17 nothing about this rough, smooth.

18 THE COURT: Very well. I'll sustain it.

19 (Bench conference concluded.)

20 Q. (By Mr. Hardin) Now, moving past the
21 threads --

22 MR. HARDIN: Can I have the screen back?
23 Thank you so much.

24 Q. (By Mr. Hardin) Moving past the threads, does
25 the claim require -- does the claim require exclusively

1 the use of friction or clamping to keep the needle in
2 the projected position?

3 A. No, it does not.

4 Q. And does that come from -- again, we were at
5 Tab 4, and we were looking at Judge Folsom's definition
6 of retainer member.

7 Does that come from that definition?

8 A. Correct. On Tab 4, Page 1, the eighth one
9 down, retainer member, that definition that the Court
10 gave, says that it uses some clamping or frictional
11 force to keep the needle in the projecting position.

12 Q. Okay. Then you talked about a bridging
13 portion, and this Section F talks about a bridging
14 portion.

15 A. Right. And that's the bridging portion right
16 there (indicates), that thin little part we saw in this
17 figure down below this one, that goes all the way
18 around, and it's very thin.

19 Q. Okay.

20 A. But it's ---it's not so thin that fluid flows
21 through it.

22 Q. Okay. And that's used to form a seal between
23 the fluid passageway and the barrel -- barrel prior to
24 retraction.

25 So what's that -- what's -- sealing what from

1 what?

2 A. Oh, what it's doing is it's sealing the
3 chamber of the barrel, which happens to be occupied
4 right now by the plunger, and -- and downstream -- or
5 anything else -- anything outside of it. Not
6 downstream -- sorry -- and any of the other areas where
7 you don't want fluid to be. So it's a seal.

8 Q. Okay. All right. So have we -- have we -- in
9 your opinion, have we covered all of the requirements of
10 this F?

11 A. Yes.

12 Q. Okay. Let's move to the next one. The head
13 portion further comprising an inner head, a continuous
14 retainer member surrounding the inner head, and a
15 bridging portion -- oh, I'm sorry; that's the same one.

16 A. Well, this is the same one, but what this
17 illustrates, this is Figure 8, which is found in all
18 three of the patents, the same figure, which shows
19 essentially a disclosure by Mr. Shaw of this exact
20 description.

21 So -- so this is sort of the support in the
22 specification for this limitation that -- that was just
23 found, I showed, in the Integra 3mL.

24 And here in Figure 8, you see retainer member;
25 you see the inner elongated needle-holding portion; you

1 see the inner head; you see the bridging portion; you
2 see the spring.

3 It's -- it's -- it's essentially the -- the
4 same -- the same kind of animal. And that's why that
5 figure was there.

6 Q. Okay. And when the plunger activates this,
7 what -- what happens? What -- what is separated from
8 what?

9 A. In -- in -- in the Figure 8 embodiment?

10 Q. Yes.

11 A. In the Figure 8 embodiment, what happens is
12 this part here is the non-retractable retainer member.
13 This part doesn't go back.

14 What gets separated is the bridging portion
15 here, and then when that's separated from this, this is
16 now released from being held by this and -- and the
17 friction over here, and the spring fires this up -- up
18 in -- into the plunger, into the retraction position.

19 Q. And does the cutter do the same thing in the
20 BD product?

21 A. Yes, sir.

22 Q. Okay. That's the BD 3ml syringe?

23 A. Correct.

24 Q. Okay. Can we move on to the next limitation
25 in this claim?

1 A. This is simply that there's a compressed
2 retraction spring, but it must surround at least part of
3 the elongated needle-holder portion and bias the inner
4 head towards the back end.

5 And here we go. Here's the spring; you've
6 already seen it. It's biasing the -- it surrounds at
7 least part of the elongated needle holder. In fact, it
8 surrounds almost all of it. It's just not this part.
9 And it biases the inner head. That's this -- it's
10 biased on -- it wants to send it that way.

11 As soon as these things are cut or broken or
12 fractured, this whole thing is going to the left to be
13 sucked into the plunger, safely inside the syringe.

14 Q. Okay. And the next limitation?

15 A. The last known limitation on the first page is
16 that a retractable needle extends from the front portion
17 through an opening. And this is straightforward. We've
18 already talked about it.

19 There's the needle extending from it. You
20 can't see the rest of it. The pointy part is out here,
21 but that limitation is met as well.

22 Q. Okay.

23 A. Okay. Page 2, now it stays the retractable
24 needle being held in fixed relation -- in other words,
25 the needle can't move -- with the elongated needle

1 holding portion and be in fluid communication.

2 Well, here it is; it's glued; it's fixed. And
3 at the end of this needle, it opens up and goes right
4 into here, and then heads off into the -- into the
5 chamber. So --

6 Q. So this limitation is also present in the 3ml
7 syringe?

8 A. Yes. Very straightforward.

9 Q. Okay.

10 A. J: This is -- you've seen this before. This
11 is the plunger reciprocally disposed, meaning that it
12 can go back and forth. That's straightforward. So
13 that's met.

14 And we go to K, and this simply states that
15 the plunger is receivable into the barrel through the
16 back end. Well, this plunger is loaded this way
17 (indicates). That's how -- that's how -- that's how you
18 put it together. And so there's -- no discussion about
19 that.

20 There's an outer wall, and there's a plunger
21 seal. That's that black rubber thing at the front end.
22 You remember these colors are just for color-coding
23 purposes. But that's a black rubber thing at the end
24 that has to not move relative to the -- to the plunger.
25 And there it is. The plunger is sealed, sealed

1 engagement between the plunger and the barrel. So the
2 seal is against the barrel wall that prevents fluid
3 leakage between the plunger and the barrel.

4 So inside, of course, is a retraction cavity,
5 but I think that's in the next limitation.

6 Q. Okay.

7 A. Okay. So that's met.

8 Maybe I missed it.

9 L: The plunger seal element being restrained
10 -- oh, I prespoke about this.

11 The plunger seal element being restrained from
12 sliding longitudinally along the outer wall of the
13 plunger, and that's the black seal right here is not
14 allowed to move relative to the -- to the plunger
15 itself. It must remain restrained. Fixed relationship,
16 can't move, can't slide relative to the plunger.
17 And in the -- in the Integra 3mL product, it's -- it
18 doesn't move. So that -- this -- that limitation is
19 also met by the Integra 3mL.

20 M: And a back end with an end cap having an
21 outer periphery. Well, here's your end cap. And one of
22 the aspects of an end cap is an outer periphery. See
23 that little surface there? It goes all the way around.
24 This is the Integra 3mL taken directly from drawings,
25 engineering drawings, of BD. So that takes care of M,

1 and it should get a checkmark.

2 And now we go to N. And this is a barrier
3 disposed in the front-end portion of the body. That
4 tells you where it is. And now it just tells you what
5 it does. It limits forward motion of the needle-holding
6 portion and the retractable needle relative to the body
7 plunger during injection and retraction.

8 Now, this is -- this one bears paying close
9 attention to -- whoops -- or disappearing. There we go.
10 Now, what you have here is the barrier is the green
11 part. The barrier is what prevents this part, the
12 retainer member, from moving in this direction
13 (indicates) while you press on the plunger or even
14 activate retraction.

15 So that serves as a barrier to stop forward
16 motion that might create what would appear to the
17 patient as jabbing.

18 There's a second area of the green part. This
19 little cone right here -- and, once again, that's in
20 section -- that's a cross-section. This is kind of a
21 cylinder. But there's a little tiny gap between the
22 back end of the red part and the front of the green
23 part.

24 We might see it again in another animation.
25 But that, too, is a barrier. So there are two barriers

1 at work, but they are both part of this green part,
2 which is, in fact, the front portion of the barrel.

3 Q. Okay.

4 A. Oh, and now there's the activation. There was
5 the cutter cutting it. You see the non-retractable --
6 oh, thank you.

7 You see the non-retractable part here
8 remaining, and the retractable parts went off there.
9 And here's the end of that cone I told you also served
10 as a barrier. This is a barrier for that, and this is a
11 barrier for -- this is a barrier for -- for the portion
12 that got cut away, meaning you couldn't jab it out any
13 further and -- and sort of hurt the patient anymore than
14 you already had to do.

15 Q. Okay. Thank you.

16 We have one last final requirement to close
17 our box and finish our claim. What's that?

18 A. Well, we've actually already seen this. So
19 what happens is the continuous retainer member -- that's
20 this part that we talked about, the flange already -- is
21 releasable from the inner head when the plunger is
22 further depressed.

23 But now the plunger is depressed to that first
24 position. The medication has essentially been
25 delivered, and now it goes through, cuts it. The thing

1 you just saw happens, and that's exactly what's
2 described in this limitation.

3 The plunger is further depressed, and the
4 continuous retainer member is released from the inner
5 head. And the inner head has the needle on it, and that
6 goes up inside.

7 Q. So we had, unfortunately, two pages full of
8 pieces of the claim, all descriptions of the claim.

9 A. Yes, sir.

10 Q. Some of which Judge Folsom has given us extra
11 information on behind Tab 4.

12 A. Yes, sir.

13 Q. And is it your opinion that the 3mL Becton
14 Dickinson Integra product uses each and every one of
15 those described features in the claim?

16 A. Yes. The Integra 3mL infringes -- literally
17 infringes Claim 43 of the '224 patent, because it meets
18 each and every limitation literally of -- of Claim 43.

19 Q. Okay. Now, against this same product, we have
20 some other claims in this same patent, so these are what
21 we call dependent claims.

22 So they're -- to infringe those, Integra had
23 to have all of those things, correct?

24 A. That's right.

25 Q. And to infringe these other claims, it had to

1 have some additional features?

2 A. Correct.

3 Q. And I would direct your attention to Claim 55.
4 So that, again, would be -- for the '224 patent, would
5 be the numbered Paragraph 55 in Column 24, the last page
6 of the patent.

7 A. Yeah. That's behind Tab 3.

8 Q. Okay. And what is the additional feature
9 that's required for the -- in order that the 3mL Integra
10 that has all of those other features, what else does it
11 have to have in order to infringe Claim 55 in addition
12 to Claim 43?

13 A. Okay. Now, Claim 55 is in Column 24 in the
14 last page on the right side about Line 18 or so. And it
15 says -- whoops, sorry about that -- the syringe assembly
16 of Claim 43.

17 So this means it has to have everything that
18 was in Claim 43, plus this additional narrowing
19 limitation, wherein the retraction cavity is vented
20 behind the plunger seal element.

21 Well, the plunger seal element, of course, you
22 know is up here (indicates), and we've already shown
23 that in connection with the '077 that the Integra 3mL
24 product is vented.

25 So here we see that same -- the end of that

1 animation again.

2 Q. Okay. And then to this Claim 60, we've also
3 asserted -- RTI is also asserting that Claim 60 from
4 this patent is further infringed by the 3mL Integra.

5 What additional feature does the 3mL Integra
6 have that makes it infringe Claim 60 in addition to
7 Claim 43?

8 A. Just looking down at the five claims down on
9 the left page there in Column 24, you see the syringe
10 assembly of 43 wherein the continuous retaining member,
11 which was that red -- red flange part here -- has an
12 outside mating surface making a fluid seal with the
13 barrel.

14 And that fluid seal is right there. It's
15 where red meets blue. That, of course, goes all the way
16 around, and you can see it here. So that's where that
17 seal is made.

18 So that limitation is also met.

19 Q. Okay. And, finally, with respect to this
20 product for this patent, RTI asserts that this Integra
21 3mL product also infringes Claim 61.

22 A. Correct. Claim 61, which is the next to the
23 last claim in the patents is the last one that's being
24 asserted, says that the syringe assembly of Claim 43
25 wherein the body and the elongated needle holder

1 cooperate as a spring guide during compression of the
2 retraction spring.

3 Now, before the animation goes, that says that
4 this portion here (indicates) and the red part that
5 comes in -- remember the elongated needle holder --
6 cooperate as a spring guide. And you'll see how nicely
7 it does that.

8 If we could begin the animation, you'll see it
9 happen.

10 Here comes the spring; it's guided there on
11 the outside. Here comes the inside. And that's just
12 kept so nicely there.

13 And so the 3mL Integra as made by BD, it meets
14 that limitation and also infringes -- literally
15 infringes that Claim 61 of the '224 patent.

16 Q. Now, is there anything particularly important
17 about the fact that the -- that that -- those two things
18 cooperate and guide the spring as it's compressed?

19 A. Oh, it's a wonderful -- it's an assembly aid.
20 It's an absolute assembly aid and, also, it's a
21 housekeeping aid.

22 Springs, unless they're, you know, controlled
23 get all wiggly and stuff. And so this particular added
24 feature is a great way to manage a -- a -- a spring in a
25 product.

1 Q. Okay. All right. Does that conclude your
2 opinion with respect to that first product, that 3mL
3 Integra product in this patent, '224?

4 A. Correct. That's all the infringement issues
5 regarding the 3ml, the larger of the two.

6 Q. Okay. Now, we have to go back. We're going
7 to, unfortunately, go and we'll try to go a little
8 faster, because we've been through the wording of the
9 claim once.

10 But we're required in order to prove that
11 Becton Dickinson is not just using Claim 43 in its 3ml
12 Integra. It's RTI's assertion that they also use that
13 same claimed invention in their smaller product, their
14 3 -- their 1ml.

15 A. Yes, sir.

16 Q. And have you analyzed that question?

17 A. I have.

18 Q. And did you compare the structure of the 1ml
19 to each and every claim limitation in Claim 43?

20 A. Yes, I compared the structure and the form of
21 the product and the engineering drawings and did exactly
22 the same thing to those two pages' worth of limitations.

23 Q. Okay. And they make the 3 -- they make the
24 1ml. The retraction mechanism still has a cutter. It
25 still has a spring, still has a retraction -- it has a

1 retraction mechanism that includes a retainer member, a
2 bridge, and a needle holder.

3 Am I correct?

4 A. That's correct.

5 Q. Okay. But they are shaped somewhat
6 differently?

7 A. That is correct.

8 Q. And so in order to make sure that the jury
9 understands that when they're asked a question whether
10 these two different products infringe the same claim,
11 it's required for us to have you explain with respect to
12 this different structure for the 1ml how its structure
13 fits the definition of each of these claim elements?

14 A. Yes. That's right.

15 More than one structure or device or
16 arrangement can infringe these claims. And in this
17 case, both the 3ml and the 1ml infringe Claim 43 and
18 some other of the dependent claims.

19 Q. Okay. So now we've -- we've sort of been
20 educated once, so we'll -- we'll -- I would like you to
21 focus on your descriptions when the language comes up on
22 the -- on the structure of the 1ml.

23 A. Certainly.

24 Q. Do we have the same introductory phrase and it
25 fits the 1ml just like it did the 3ml?

1 A. That's correct.

2 Q. And next -- the next limitation is a hollow
3 syringe body comprising a barrel and having a front-end
4 portion.

5 A. Right. And what we have here from an
6 engineering drawing of BD, here's the 1ml barrel. This
7 happens to be a one-piece barrel, and it zooms out, and
8 now here's the actual -- sort of blinky -- here's the
9 actual barrel dropping down right on top of the drawing,
10 and then we sectioned part of it so you can see inside
11 of it.

12 So here's the back-end portion, and here's --
13 here's the front end. So that limitation is met,
14 slightly different from the 3ml but nonetheless meets
15 it.

16 This is -- we can handle it very quickly.

17 Here are the two finger grips that are
18 required, essentially, by C, and I don't think there's
19 any dispute there.

20 We can go on -- yeah, we're looking for a
21 retraction mechanism disposed in the front-end portion.

22 Now, here it's worth pausing to note that in
23 the 1mL Integra instead of the cutter being in the
24 plunger, the cutter is on the other side. They put the
25 cutter down here in the nose. And so there's a cutter

1 right there.

2 The springs on the inside of the cutter and
3 the elongated needle holder is inside of that. And this
4 is a BD drawing, and that's showing a retraction
5 mechanism in the front-end portion, which we referred to
6 in the previous slide.

7 Q. Mr. Sheehan, just stop a minute there, because
8 you pointed out this has a cutter, and the claim doesn't
9 say anything about a cutter.

10 Does that mean that this device can't
11 infringe?

12 A. No. No. The fact that it has a cutter is --
13 is irrelevant. It could have a cutter; it could not
14 have a cutter; it could have some other means.

15 Earlier, I referred to bells and whistles,
16 which I didn't mean they were insignificant things. I'm
17 just saying if you have these limitations, you infringe
18 whether you use a cutter, whether you use dynamite or
19 whether you use some kind of other means. All of those
20 things contemplated infringement.

21 Q. So I interrupted you.

22 A. Sure.

23 Q. So you were -- this is a retraction mechanism
24 that is disposed in the front-end portion of the 1ml?

25 A. That is correct. This is the tip of the 1ml.

1 This is the smaller one. It's really hard to see.

2 Q. Okay.

3 A. But there you go.

4 So you have a checkmark there.

5 Now, once again, a little more description
6 about that retraction mechanism, and we run the slide.

7 Here's an engineering drawing of the needle-holder part.

8 Oh, I hasten to point out, this is pointing to
9 the left. The other one was pointing to the right, and
10 that's not to confuse people. That's how the
11 engineering drawings at BD were made.

12 So just remember, if it points to the right,
13 it was the 3ml. If it points to the left, it's the 1ml.

14 So here's an elongated needle-holding portion
15 right here. It looks kind of familiar. Here's a head.
16 Here's the fluid path. And then this is met. I believe
17 that's it -- yeah, E.

18 Now comes F. Now here's a little more detail,
19 you remember, about the -- about the needle adapter
20 part. Sorry. We covered up something pretty quickly.

21 Okay. Here -- the head further comprising an
22 inner head. Okay. Here's that inner head. There's a
23 general head, and this is the inner head. This looks
24 very much like the 3ml here. There's a gap underneath
25 the bridging portion that's required. Here's the fluid

1 paths. This is where you put the needle in.

2 But now, importantly, this is a continuous
3 retainer member, and this is where we have to refer to
4 the Court's construction regarding what that means
5 regarding some clamping or friction.

6 And I don't know whether it's the next slide
7 or eventually, but we will address that.

8 Q. Okay. Let's move to the next slide.

9 A. What you see here is the front end of the
10 arrow. Zooming in at the blueprint, if you will, of the
11 front end of the barrel. And you can see -- okay.
12 This -- (reading).

13 Oh, okay. What we're looking at here is we're
14 looking at dimensions in order to form a fluid seal.
15 I guess -- (reading). Anyway, what's on these
16 dimensions, just what's on these drawings -- I'm
17 sorry -- these are the dimensions of importance on the
18 front end of the barrel.

19 I'm sorry. Switching from the 3ml to the 1ml,
20 I had to regroup for a second.

21 This dimension here, 178, is the inside
22 diameter right in here. 175 is the diameter right here.
23 And 178 is the diameter right in the front here.

24 So these are three diameters (indicates). You
25 don't have to memorize these right now, but these are

1 three important diameters that exist in the front end of
2 the barrel.

3 We will now take a look at the diameters at
4 the -- in -- in the corresponding location on the
5 elongated needle holder with the retainer, and we see
6 183, 177, and 180.

7 And when you put those next to each other,
8 what you notice, and -- and what will happen here
9 shortly is these two drawings will be merged, even
10 though they are not assembled like that. You know the
11 red part is put from the right and the back end of the
12 blue part.

13 And now, as it darkens up, right here and
14 right here (indicates), meaning all the way around the
15 outside, you have a press fit. Earlier today, I was
16 asked and I think I explained about what a press fit and
17 interference is and where the friction is.

18 What we have here is exactly that. The way we
19 know that is let's go back -- or let's go forward and
20 take a look at those dimensions that we saw earlier.
21 The blue part represents the needle-holding thing. The
22 retainer member that's being shoved inside the red line.
23 And the red line represents the interior of the barrel.
24 Now, look at the first set of dimensions. You see that
25 this is 183. 183/1000. Doesn't sound like a lot but

1 it's enough. And this is 178. So you see the blue
2 part, the cork is bigger than the bottle by this much.
3 It's sticking out by that much.

4 When we move over to this other area, we see
5 that 177 is greater than 175. And when we get to the
6 next one you see that 180 is greater than 178.

7 Now, I prepared a zoom-in of that part where
8 it overlaps.

9 What this shows here, you see all this area
10 here, this darkened color, well, that's the wall of the
11 barrel.

12 The blue line represents the retainer member
13 being press-fit in there. All of this area here where
14 this -- what appears to be an overlap, that's how much
15 bigger the blue part is than the red part. This is
16 5/1000 in diameter bigger; 2/1000 in diameter bigger;
17 2/1000 in diameter bigger.

18 That alone would tell one of ordinary skill in
19 the art there's a press fit and there's friction and
20 that's holding the needle in -- in the projecting
21 position.

22 Just remember, the needle is attached to this
23 blue part and is going out over here to the left.

24 So --

25 Q. You're talking in thousands.

1 A. Yes.

2 Q. That doesn't sound very much; it doesn't sound
3 very much. We have these point zeros; those are
4 thousands of inches?

5 A. That's a thousandth of an inch.

6 Q. And so it doesn't look like a lot of overlap,
7 but you're -- you're an expert in the molding field and
8 medical device molding at least.

9 So is that enough to cause any real amount of
10 friction at that particular location?

11 A. Oh, absolutely.

12 Q. And, again, that is just because it's -- my
13 vernacular was it's sort of squashing it down when it's
14 shoved in?

15 A. Correct. That's what happens. It's like the
16 cork in the bottle. And one design to that in order to
17 create friction --

18 Q. So that --

19 A. -- to create a seal.

20 Q. So that little -- that needle holder at the
21 retainer end, does it have a little bit of give? If it
22 was -- does the barrel and the retainer member both have
23 just a little bit of give?

24 A. Yes. As I described earlier, when this
25 happens, when you shove the blue part into the red part,

1 the red part's pushing down saying no way. So the blue
2 part kind of squashes a little bit. And then the red
3 part also kind of stretches out a little bit.

4 And they can't occupy the same space.
5 Everybody knows that. And so what happens is they reach
6 an accommodation, and that accommodation, nonetheless,
7 has -- has -- the forces are still there. You know, the
8 cork is still pushing -- you got the cork into the hole,
9 but something gave. In that case, the cork gave.

10 THE COURT: Mr. Hardin, is this a
11 convenient breaking point? We have a member of the jury
12 who would like a break. So we're going to take a short
13 10-minute break or so.

14 MR. HARDIN: Yes, Your Honor.

15 COURT SECURITY OFFICER: All rise.

16 (Recess.)

17 COURT SECURITY OFFICER: All rise.

18 (Jury in.)

19 THE COURT: Please be seated.

20 All right. You may continue direct
21 examination.

22 MR. HARDIN: Thank you, Your Honor.

23 Q. (By Mr. Hardin) Mr. Sheehan, we were looking
24 at your drawing, which has the blue line and the red
25 line, and what I understand is, is that we're -- we're

1 stuffing something bigger into something smaller, and in
2 your opinion, that creates friction.

3 A. Yeah. It creates a press fit or an
4 interference fit and creates a frictional force.

5 Q. Okay. And there's some other structures
6 there. The wall is not straight here. The wall has --
7 in two places -- and this is an accurate depiction, is
8 it not, of the Integra 1mL?

9 A. Yes. This is taken directly from the
10 engineering drawings myself.

11 Q. And it has -- it has what I would characterize
12 as a bump here and then a lower bump here (indicating)?

13 A. Yes, sir.

14 Q. Did you take those into account in forming
15 your opinion about whether this device operates using
16 clamping and friction?

17 A. Absolutely, yes, I did.

18 Q. Okay. How do those affect whether or not
19 the -- the retainer member is being held in place by
20 clamping or friction?

21 A. Well, let's deal with the back bump first.
22 As you can see, there's a space here (indicating). The
23 back bump doesn't even contact the blue part. So that
24 really doesn't come into play.

25 And, of course, back here is -- is -- is the

1 barrel, is the plunger, and that is, in fact, sprayed
2 with silicone. And so anything that enters this area
3 becomes highly lubricated.

4 A lot of people don't know. All syringes are
5 sprayed on the inside with silicone. That's why they
6 slide. If you didn't do it, they wouldn't slide.

7 So my dad being a Type I diabetic over 55
8 years put a lot of silicone into himself and still lived
9 to be 88 years old.

10 Having said that, the silicone back here is to
11 make everything from here back slippery (indicating).

12 So not only is this bump not even in contact;
13 it's got lubricant on it.

14 Now, this bump up here has merit (indicating).
15 This -- this -- this bump here is worth considering.
16 This is called the hub locating ring or hub location
17 ring, one of the two. And clearly, the plan here by BD
18 is to use this as kind of a guide as to how to line them
19 up.

20 Now, because there's a press fit here and
21 because these things -- two different things cannot get
22 by the same force -- place, these things are going to
23 reach an accommodation somewhere in between, and they're
24 going to line up.

25 Now, the press fit is still there. The

1 friction is still there. That's all -- that's here;
2 it's here; it's all here; it's all friction
3 (indicating).

4 But here (indicating), there's a -- what I
5 would term a mechanical contribution that is, in fact,
6 not friction. And that's the result of the bump of this
7 bump right here (indicating) being in the way of this --
8 well, let me think about this.

9 This goes -- yeah. It's this bump coming
10 against this bump (indicating). Right. Right.

11 So -- so the bottom line is, whereas in the
12 3ml, it's purely clamping, clamping that flange, and
13 there's purely friction in those types of threads; in
14 this situation, it is predominantly friction with a --
15 with a little bit of mechanical.

16 Q. Okay. Does that somehow affect your opinion
17 as to whether or not this structure meets Judge Folsom's
18 definition of a retainer member?

19 A. Oh, not at all. No. Meets it completely.

20 Q. Now, have you ever heard -- you told the jury
21 about something called a press fit.

22 A. Yes, sir.

23 Q. And you believe this to be a press fit.

24 A. Yes. That is absolutely a press fit.

25 Now, we're --

1 Q. Have you ever heard --

2 A. I'm sorry. We're just looking at one side,
3 remember. This goes all the way around. This is --
4 this is a circular thing. This is a plug going into a
5 tube.

6 Q. Have you heard the term snap fit ever?

7 A. Oh, sure. The term snap fit is commonly
8 used to -- it can be a number of things.

9 Q. Does a snap fit -- to you, as an engineer,
10 does a snap fit mean there's no friction involved?

11 A. Oh, not -- no, no. A snap fit -- generally
12 speaking, snap fits -- some snap fits can involve
13 friction. Some snap fits have no friction.

14 But regardless -- because it's kind of a broad
15 term. Engineers -- engineers that are equally educated
16 and equally experienced will call different things snap
17 fits. There's a range of definitions.

18 But what is without question is that there's a
19 press fit here, and there's friction, a frictional
20 force.

21 Q. Okay.

22 MR. HARDIN: Can I have Exhibit 211,
23 please.

24 Q. (By Mr. Hardin) Is this a document you
25 reviewed in concluding that Becton Dickinson 1mL syringe

1 infringes Claim 43 of the Shaw patent?

2 A. Yes. This internal document from Becton
3 Dickinson, from one person to another within Becton
4 Dickinson, simply confirmed the fact that there is an
5 interference fit.

6 THE WITNESS: And I think if we zoom in
7 there -- oh, there you go.

8 A. The hub to barrel interference -- that would
9 be the interference fit -- was increased by making the
10 nominal hub seal diameter from 182 to 183.

11 That 183, that was that number -- that was one
12 of those numbers we saw when we saw all those six
13 numbers. 183 is -- they actually increased it. They
14 made a 182 -- they made it -- they increased the
15 friction and interference to 183.

16 Q. (By Mr. Hardin) And do you remember why they
17 were doing this?

18 A. Yes. My recollection is because they were
19 having a leak, having leak problems.

20 And it turns out that it wasn't quite because
21 of that reason. It turned out that the automatic
22 assembly equipment, I think, was pushing it in too far
23 or something like that.

24 But this was an attempt to create a greater --
25 greater seal or more friction.

1 Q. Okay.

2 MR. HARDIN: And can we see Exhibit 214.

3 Q. (By Mr. Hardin) Is this another document,
4 internal BD document, that you considered in drawing
5 your conclusions?

6 A. Yes. This, once again, was a BD document that
7 simply confirmed my conclusion, and it's a little hard
8 to see -- there it is. It's the next to the last bullet
9 point.

10 The hub OD -- that means outside diameter, the
11 outside diameter -- was increased to address leakage --

12 THE WITNESS: Oh, there you go.

13 A. -- leakage observations that were made during
14 the original design verification testing.

15 This is something that you have to do -- the
16 FDA makes you do.

17 This was later determined to be hub position
18 related from the hub assembly machine, not the hub OD
19 tolerance. But, nonetheless, they kept it and this
20 increased OD will cause additional frictional forces to
21 be felt during activation.

22 Q. So what --

23 A. So this is -- verifies there are frictional
24 forces.

25 Q. What is OD?

1 A. Outside diameter.

2 Q. So this document is talking about increasing
3 the outside diameter of the inside part.

4 A. Yes. The outside diameter of the inside part
5 got bigger. That would be the blue part. But now
6 it's -- we'll make it -- we're going to make it push a
7 little bit harder, and that causes additional frictional
8 forces.

9 Q. Okay. Now, does Mr. Shaw's patent teach doing
10 the same thing to increase frictional forces?

11 A. Yes. Mr. Shaw's patent is very specific about
12 this.

13 Q. Okay.

14 A. In fact, it describes it to a T.

15 Q. Okay. So this is the '224 patent and the --
16 which is at -- it's at Tab 3, and this is at Column 3,
17 Lines 45 through 51.

18 A. Yes. So Column 3 is on -- on the page that
19 had Columns 3 and 4 on it. It's on the right -- the
20 left column. And you find the number in the middle, and
21 you kind of work your way down to about 45.

22 And on your left is the following paragraph,
23 which will --

24 THE WITNESS: Yeah, zoom up here. Thank
25 you.

1 A. The outwardly facing surface on the circular
2 head of the needle-holder is slightly greater in
3 diameter than the circular inward facing surface in the
4 wall at the most constricted portion where the nose
5 begins.

6 The needle-holder is thus clamped in position
7 by hoop stresses induced in the outer body and held in
8 position by a frictional holding force.

9 And then later on, the needle-holder is
10 released in response to depression of the plunger to a
11 retraction position.

12 So this is exactly -- this is described in the
13 patent, and it's exactly what BD described in their own
14 documents that they did.

15 Q. (By Mr. Hardin) Okay. Now, how is that -- so
16 the frictional forces being released in response to
17 depression of the plunger, correct?

18 A. That is correct.

19 Q. And what happens in the BD Integra device?

20 A. In the BD Integra 1mL --

21 Q. Yes, sir.

22 A. -- device?

23 Q. Yes, sir.

24 A. What happens is the frictional force is
25 released from the needle-holder such that the

1 needle-holder can retract, and the non-retractable part
2 can remain behind, being non-retractable.

3 Q. When that needle-holder is back up inside the
4 barrel --

5 A. Oh, the -- just like in the 3ml, the
6 needle-holder heads right back up inside this syringe up
7 inside -- it's going to eventually be inside this little
8 plunger.

9 This is hollow. I think we already saw the
10 retraction cavity part, but this is hollow. It's --
11 they kind of colored it white. You can't quite see
12 inside, but it's hollow.

13 Q. And is there any friction left on that
14 needle-holder once it's back up inside the barrel?

15 A. Oh, no. It's free to fly.

16 Q. Okay. Okay. Let's look at the -- we were
17 stepping through this claim. Let's go back to the claim
18 and look at the next portion of the claim.

19 A. Okay. That was -- that was a long stop. The
20 next ones are shorter stops.

21 A compressed retraction spring surrounding at
22 least part of the elongated needle-holder. Well, here
23 we go. Here's the -- here -- once again, the spring
24 essentially surrounds the vast majority of the elongated
25 needle-holder, being the red part.

1 So that's the spring. You can't see the
2 spring, because it's inside the cutter, which has been
3 moved from this side to that side, but, nonetheless,
4 there's the spring.

5 Q. Okay. The next limitation. We get a
6 checkmark there, I guess.

7 A. Thank you. Yes. Oh, thank you. Yes. That's
8 the last one.

9 Now, the final one on the first page is that
10 the retractable needle extending into the front portion
11 through an opening in the front end of the body. And
12 that's exactly where you put the needle. You put the
13 needle through an opening in the front end of the body.

14 And once again, just like on the 3ml, it was
15 facing the other direction, you put glue in here, and
16 you seal that up, and now you've got a direct path from
17 the tip of the needle sealed all the way through the
18 needle and out into the chamber here where the medicine
19 is and the -- and the plunger for pushing it.

20 Q. Okay. Next limitation.

21 A. Now we're going to Page 2 at the top is I.
22 Let's see, retractable needle being held in fixed
23 relation to the elongated hub. We've seen this
24 limitation before when we discussed the 3ml.

25 And basically, it's the same sort of thing.

1 Here's the needle. It's held in fixed relation. In
2 other words, the needle cannot move, and it's in fluid
3 communication.

4 Straightforward. I don't think we have any
5 dispute here.

6 Q. All right. Next limitation.

7 A. It's really straightforward again. This is
8 the fact that the plunger moves back and forth. You saw
9 this on the 3ml when it was coming from the other
10 direction, and now you're going to see it coming from
11 the other direction. And here's the plunger being able
12 to move back and forth.

13 So that -- that gets the green checkmark
14 there.

15 Q. Okay.

16 A. Going to the next one, this is a little bit
17 longer, but, happily, all these little words on the
18 picture are going to make it easier for all of us.

19 It says the plunger being receivable through
20 the back end. Well, of course, the plunger was put in
21 here through the back end. No argument there.

22 It has an outer wall. There's the plunger
23 wall. It has a retraction cavity. Remember, I held
24 up -- you couldn't see inside of it, but maybe you could
25 see that little hole there.

1 And here's the plunger seal in the front end.
2 And that plunger seal is in -- this is in seal
3 engagement with the barrel, so it works like a typical
4 syringe.

5 So all of these limitations are met by the 1mL
6 Integra syringe.

7 Q. Okay.

8 A. Now -- oh, this is that limitation that says,
9 the plunger seal is restrained from moving -- sliding
10 along the -- essentially, the plunger.

11 Now, it's hard to see here, because this is a
12 section, but there's a black line here, some black here,
13 black here (indicating). That represents -- that
14 represents the rubber part on the tip -- I want to hold
15 it up again -- the black part on the tip of the -- of
16 the plunger (indicating).

17 And what that means is, this can't move. This
18 has to stay in position relative to the plunger. And of
19 course -- well, I just showed you. This is true about
20 the 1mL Integra.

21 Q. Okay. Thank you.

22 It has a back end with a cap having an outer
23 periphery?

24 A. I hardly have to speak. There it is.

25 Q. Okay. And finally -- not finally.

1 A. Once again, this is that barrier limitation
2 which we had only seen this for the first time in this
3 claim.

4 In this case, the barrier is actually the
5 cutter. Because as you push -- as the plunger comes
6 down and pushes forward, what stops the forward motion
7 is actually the cutter.

8 And it does it in two places. It does it here
9 at the cutting tip, and it does it here and here
10 (indicating) where it takes a little bit of bend. Hard
11 to see. We might see it better in an animation.

12 Q. Okay. So that gets a check?

13 A. That gets a check. Oh, is -- perfect.
14 There's that little bend in the cutter.

15 And now it says, wherein the continuous
16 retainer member is releasable from the inner head.
17 So the continuous retainer member is this part out here.

18 If you look very closely, that's that part --
19 see that little bump in there (indicating)? That's that
20 little bump that we said has to be taken into account.
21 And here it comes again around there (indicating).
22 So this is the retainer member. This is the
23 non-retractable part. This is the retractable part.
24 This is the needle-holder, right? And this is the
25 plunger (indicating).

1 Now, the plunger -- you see that sort of gray?
2 That's the cross-section of that black part.

3 Now, this -- the plunger has already been
4 pushed right up to the end. You've delivered the
5 medication that you're going to at that point. And then
6 you continue further depressing it.

7 And we'll see that happen with the animation.
8 It zooms in, and you watch the plunger here, and the
9 plunger comes, pushes the retainer member forward a
10 little bit. This cuts that and back goes everybody.
11 It goes a little faster than that, but that's the
12 retraction event in the 1ml. And so that limitation 0
13 is also satisfied by the 1ml.

14 Q. Okay. So quick summary is, for this 1ml
15 product -- we've now been through Claim 43 a second
16 time.

17 A. Correct.

18 Q. And do you find that each and every element of
19 Claim 43 is included in the 1mL Integra product?

20 A. Yes, I do, literally.

21 Q. Okay. So in your opinion, it uses that
22 definition of Mr. Shaw's invention?

23 A. Yes.

24 Q. Okay. All right. There's two other claims in
25 this patent -- short claims in this patent that we're

1 asserting against this 1ml product, Claim 55 and
2 Claim 60.

3 Can you briefly take us there? And again,
4 these are dependent claims, so, again, it requires that
5 the 1ml have all of the things we just saw, plus some
6 things, correct?

7 A. Right. And simply it means everything you had
8 in 43, except here's another condition: The retraction
9 cavity is vented behind the plunger seal element.

10 And you see there are holes here, and once
11 it's activated -- now, here the plunger comes in now,
12 and it stops, okay, medication delivered.

13 Now it's time to activate the safety measure.
14 You push a little further, and air comes flying out
15 through the vent holes here and out the back end.

16 So it's -- the retraction cavity is vented.
17 And that's the end of that -- or 55. That limitation is
18 met as well.

19 Q. Okay. And 60?

20 A. Simply -- 60 simply says that it's everything
21 in Claim 43, except that continuous container member has
22 an outside mating surface making a fluid seal with the
23 barrel.

24 So we're going to walk through these drawings
25 again. As you put the red part inside the blue part,

1 you put the needle-holder part in with the retainer
2 member and the bridging portion inside the barrel.
3 Remember, you have a press fit right here (indicating).
4 And if we look at the next -- the next slide -- well, I
5 don't know if we need the next slide. Oh, right.
6 Because we just went through this -- sorry. This is
7 meant to give you guys a little bit of a break.

8 Remember up here we had this press fit, and
9 it -- and it -- and -- and one -- the red part is bigger
10 than the blue part, and you shove it in there, and it
11 seals, and it has friction and everything, well, what it
12 does is creates a fluid seal. Not only is it held by
13 friction; it creates a fluid seal right there.

14 Q. Okay. So you concur -- you conclude from that
15 that Claim 60 of Mr. Shaw's invention, he claimed -- he
16 claimed his invention several different ways.

17 A. Yes.

18 Q. Claim 60, which is all the parts from
19 Claim 43, plus this specific limitation, Claim 60, is
20 met and found in the 1mL Integra product?

21 A. Yes, it is.

22 Q. Okay.

23 A. It literally infringes Claim 60 --

24 Q. Okay.

25 A. -- of the '224.

1 Q. All right. Let's move ever so briefly to a --

2 MR. HARDIN: Do we have a summary slide
3 for this patent before we move on?

4 If not, we can go right to the next
5 patent. That's fine. I think we've -- can we go to the
6 '733 patent, the third patent-in-suit?

7 Q. (By Mr. Hardin) Okay. The '733 patent, that's
8 Mr. -- we have three patents here, Mr. Shaw, three
9 pieces of property.

10 A. Correct.

11 Q. Each piece of property has these separate
12 pieces of the claim definition of invention, and we're
13 asserting some claims of the '733 patent against only
14 the 1m1 this time; am I correct?

15 A. That's correct. The '733 is only being
16 asserted against the 1mL Integra, the one that we just
17 watched in connection with Claim 43 from the '224
18 patent.

19 Q. Okay. Now, '733 -- the '733 shares some same
20 terms and information as with the '224 patent, correct?

21 A. Correct. We're going to see some familiar
22 material.

23 Q. Okay. And what does the '733 patent focus on?
24 You told us at the outset that we -- that was before the
25 lunch break, I think.

1 A. Sure. And it primarily focuses on a method of
2 assembly of putting everything, of course, except the
3 needle, in from behind, and also the product itself that
4 is made that way. Claim 1 refers to the product. Claim
5 24 refers to the method.

6 Q. Okay. Now, let's take a look, before we make
7 that claim comparison again, to the 1ml and how it's
8 made.

9 MR. HARDIN: Let's show Exhibit 215,
10 please.

11 Q. (By Mr. Hardin) Okay. Is this a document, an
12 internal document, from Becton Dickinson that you
13 considered in arriving at your conclusions about the 1mL
14 Integra and whether or not it infringes Mr. Shaw's
15 patent?

16 A. Yes. This is a drawing -- and essentially,
17 it's an assembly drawing. It's right here. It's part
18 of their design verification review. And it shows how
19 pieces are put together.

20 The plug is put into the back of the plunger,
21 and the -- what they call their outer hub gets put in.
22 Here's the spring. Here's the cutter. Everybody's
23 loaded from the back, except, of course, the needle,
24 which you can't load from the back because you could
25 damage it.

1 And of course, the little cap that covers the
2 needle at the end has to go on from this side.

3 But all the important stuff, the workings of
4 it, are loaded in from behind, as shown here. I don't
5 think there's a dispute about that.

6 Q. Okay. So that's sort of an overview and
7 evidence of how Becton Dickinson manufactures its
8 product.

9 Let's turn to Claim 1, which is a product
10 claim, correct?

11 A. Yes, sir.

12 Q. Okay. So Claim 1 of the '733 patent, again,
13 it begins with sort of an introductory paragraph?

14 A. Right. And I think just in our discussion
15 there, that that already got a green check, because it
16 is a tamperproof retractable syringe for injecting fluid
17 wherein the syringe has a one-piece body and et cetera,
18 et cetera.

19 Once again, this is a preamble. It's not
20 limiting, and we'll see some of these words again.

21 Q. Okay.

22 A. So that's met --

23 Q. All right.

24 A. -- even though it doesn't have to be.

25 Q. All right. The next requirement, in order to

1 demonstrate that this product uses Mr. Shaw's Claim 1 of
2 the '733 patent.

3 A. Sure. As we watched the same video we just
4 saw a little while ago, now the only difference is, is
5 that it's a one-piece hollow body.

6 Remember, before the body could be two pieces?
7 The 3mL Integra is two pieces. This is a one-piece.
8 And here it has some details about that one-piece body.

9 Q. So, Mr. Sheehan, we've seen this general
10 same -- this is the same product and the same drawings,
11 but you've colored them differently, is that true, for
12 this presentation?

13 A. Yes, because of the limitations specifically
14 present in the section.

15 Q. Okay. So I just want the --

16 A. Thank you.

17 Q. -- Court and the jury to understand that we're
18 seeing essentially the same BD drawing again. It is the
19 same BD drawing.

20 A. It is.

21 Q. But you've colored it differently in order to
22 explain why that structure also fits the description of
23 the Claim 1 of this patent.

24 A. That is correct.

25 Q. Okay. Thank you.

1 A. So as we look here, it says a one-piece hollow
2 outer body -- well, we saw that as it was being created;
3 it goes -- the rest of it goes off here -- comprising an
4 elongated barrel and a nose.

5 So the elongated barrel is the blue part.
6 This is the part with a straight constant diameter wall
7 that goes all the way back. That's the -- that's the
8 major length of the syringe, and that's pretty much
9 where the plunger lives.

10 And then it requires that there be a nose, and
11 the nose is up here in the front. This is the green
12 part (indicating).

13 And there is a transition zone connecting the
14 barrel and the nose. And the transition zone goes from
15 here where the diameter is 185 to here (indicating)
16 where the diameter is -- well, I'll tell you in a
17 second, as soon as I see the drawing.

18 But this is where the transition -- where it
19 transitions from this larger diameter to a smaller
20 diameter. And that's the definition of a transition
21 zone.

22 Q. So on this drawing, it doesn't look like --
23 first of all, it looks like there's a couple of big
24 changes in diameter out towards the nose.

25 A. They're in the nose.

1 Q. They're in the nose, right, in the nose.
2 And that purple part there -- and you have where you
3 said the transition zone is, looks like a very small
4 change in diameter.

5 A. Well, it's -- it's not huge, but it is a
6 change, and what's important is that it changes from the
7 barrel.

8 What sets this whole definition up is the
9 elongated barrel. And a barrel is a barrel in a
10 syringe. It's a smooth-walled long piece. And where
11 that ends is right there at that -- at that bump.

12 And -- and the transition zone is halfway up
13 that bump, and then we'll see in other limitations more
14 definition about that, and we'll also have some
15 discussion about this inwardly facing surface, which is
16 prematurely on this drawing, but it comes into play, I
17 think, in the next limitation.

18 Q. Now, these reduced diameters, these are --
19 these are squeezing inward, if you will, correct?

20 A. Right. As you -- let's say you're -- you
21 know, you're an ant walking along here, and you come
22 along, and you go, whoa, here's a bump, so I'm
23 transitioning.

24 And then after that, every diameter to the
25 left is always smaller than the blue diameter, which

1 makes all of this nose (indicating).

2 Q. Okay.

3 A. This is the biggest -- this is the biggest
4 diameter. Everybody else over here is smaller.

5 Q. Now, what you're calling a nose has several
6 diameters itself. Does that mean that it's not all the
7 nose? I mean, there's several diameter changes in the
8 green.

9 A. Sure. That doesn't matter at all.

10 Q. Okay. Now, what is the purpose of having that
11 nose with a reduced diameter?

12 A. Well, there's a -- one -- one -- a couple --

13 Q. From a -- from a manufacturing standpoint.

14 A. Okay. Yeah. There are two -- two benefits.
15 From a manufacturing standpoint, if you have something
16 where the diameter drops down, even if it drops down
17 just a little bit, what's great about automatic assembly
18 is, you drop something in, it tends to self feed.

19 It's like a -- kind of a funnel effect. It's
20 just -- it's a great -- if you have to make, you know,
21 millions of these and you have to make hundreds of them
22 a minute, you want every advantage. And having that --
23 that transition zone, having that happen helps.

24 Q. Okay. So let's go to the next limitation.
25 The nose having a reduced cross-section area relative to

1 the barrel and inwardly facing surface in the wall at
2 the most constricted part of the transition zone where
3 the nose begins.

4 Does this product have that?

5 A. Yes. This whole section, which you aptly
6 pointed out earlier or directed me to, all of that has a
7 smaller cross-section. And here, a cross-sectional area
8 is talking about the inside. It's not talking about the
9 outside.

10 And here we can take a look at this closeup
11 again. And you can see that here's the biggest
12 diameter, 185 out here, and every diameter to the left
13 is smaller.

14 And there's also an inwardly facing surface,
15 which is the surface here, and that's where we're going
16 to have our friction fit with the retainer member.

17 And the most constricted part of the
18 transition zone defines where the nose begins, also, and
19 that's right at the tip here. The transition zone
20 starts where the 185 starts to get smaller, and it gets
21 smaller and smaller, and it gets to the most constricted
22 part, and right there is where the transition zone ends.
23 It's a very small transition zone, but that's the
24 definition of it.

25 Q. Okay. What's the next limitation for this

1 product in this claim?

2 A. Oh, the reason this is up here is because
3 potentially an issue might be raised regarding whether
4 something is at the most constricted part in this --
5 in -- in the 1ml.

6 And what this shows, that in Figure 8, which
7 is in all three of the patents, it shows that the
8 inwardly facing surface against which -- against which
9 the retainer member presses is not adjacent. It's not
10 toe to toe with the most constricted part.

11 What this tells you, what this reveals and
12 discloses in the patent, that it's okay to have a little
13 bit of distance between your retainer member and the
14 most constricted part.

15 So the word at does not mean touching, exactly
16 touching; it means like, hey, I'm at your house; I'm in
17 your car sitting outside your house; I'm at your house.
18 It's at in a broader sense. So that's why I added that
19 illustration.

20 Q. So if it was -- if we took a very tiny
21 definition of at and said I got to be like in your
22 living room, this drawing would have shown this surface
23 to be right here?

24 A. Oh, if it had to be -- if -- if the limitation
25 were written to say toe to toe and immediately adjacent

1 and stuff like that, yes, then that would be line to
2 line like that.

3 Q. Okay.

4 A. But, clearly, the inventor says it's okay to
5 have it like that.

6 Q. Okay. And is -- in the 1ml, is the retainer
7 ring at this most constricted -- at the most constricted
8 part of the transition zone where the nose begins?

9 A. It is.

10 Q. Okay. What's the next limitation of this
11 claim?

12 A. A plunger assembly disposed partially within
13 elongated barrel. Well, that's probably our easiest
14 one. There it is. There's a plunger disposed partially
15 in there. So it's part way in.

16 Q. Okay. And then the next?

17 A. This -- this says the plunger having a head in
18 slidable sealed contact -- meaning when you slide this
19 up, this head is going to seal with the outer body -- a
20 forward portion, and a retraction cavity therein.

21 Okay. Here's the forward portion. Here's the
22 retraction cavity within -- that's that head. That's
23 that black rubber thing that I showed you earlier
24 holding it up over here.

25 And inside of that -- it's hollow, and there's

1 a retraction cavity. There's this little window here.
2 We'll talk about that soon. And there's a little plug
3 that plugs up the back.

4 None of this is this color. This is all sort
5 of a white -- a milky white color. It's not all red.
6 This is just for your benefit -- help -- help.

7 And so this limitation is met.

8 Q. All right. Next, it says, a retraction
9 mechanism sealingly disposed in the nose.

10 A. Right. Okay. We've seen a retraction
11 mechanism disposed in the nose. All this adds is that
12 it's sealingly disposed in the nose.

13 And we know it's sealingly disposed in the
14 nose because we know there's a seal here, because there
15 is a interference fit. There's friction. There's a
16 seal. There's a frictional hole. Nothing's getting by
17 this.

18 And, of course, the bridging portion is still
19 solid. So it's sealingly disposed in the nose.

20 Q. Okay. So that gets a check.

21 A. That gets a check as well.

22 Q. Next, it says, a retraction mechanism having a
23 retractable part comprising a needle-holder having an
24 elongated body, having a needle-holding tip portion in
25 the front and a head and back, a passageway defining a

1 fluid path through into a variable fluid chamber in the
2 barrel below the plunger and a spring applying
3 retraction force to the retractable part.

4 A. Okay. Everything except the spring can be
5 seen right here. You see the head. You see the
6 needle-holder. You see the fluid path. The head's in
7 the back. The passageway defining a fluid path.
8 Everybody's -- everything is here.

9 And now on the next image, you're going to see
10 a familiar picture, and there's that spring. So
11 everybody's accounted for. Everybody meets this
12 limitation. And the 3ml -- the 1mL Integra also has
13 that limitation met.

14 Q. All right. Next is a retractable part being
15 configured to be able to retract into the retraction
16 cavity of the plunger when retraction is initiated.

17 A. Well, here you go. Retraction is about to be
18 initiated, and there it goes, and it retracts into the
19 retraction cavity.

20 Q. Okay. So that limitation is met, also?

21 A. That one is met as well.

22 Q. A retraction mechanism further including a non
23 -- oh, I'm sorry.

24 Retraction mechanism further including a
25 non-retractable part comprising a retainer member

1 surrounding the head of the needle-holder. The retainer
2 member and said head of needle-holder being removably
3 coupled by a bridging portion between them.

4 A. Okay. This drawing with all of these arrows
5 explains pretty much everything. Here's the fluid path.
6 Here's the needle-holder. Here's that retainer on the
7 outside.

8 A little different from before. It doesn't
9 say continuous retainer member; it just says retainer
10 member, but same thing. Bridging portion. Here's the
11 head. Here's the gap. It's all there.

12 Q. Okay. Now, this does use the term retainer
13 member. So, again, using Judge Folsom's definition,
14 does this meet the definition Judge Folsom gave for
15 retaining member?

16 A. Absolutely.

17 Q. All right. What's the next limitation?

18 A. Well, I think -- I think we're continuing on
19 in this one to show -- oh, this has to do with the
20 definition of retainer member showing the presence of
21 friction.

22 So pardon the repetition, but here are those
23 different diameters showing that the blue part's bigger
24 than the red part, and here's your press fit
25 interference.

1 And so that one is met.

2 Q. Okay. All right.

3 A. The next one requires that the needle-holder
4 and spring be installed going to the nose from the rear,
5 and the sliding engagement, et cetera. And you're going
6 to watch this happen.

7 In fact, I think you watch -- yeah, here comes
8 the -- there's the cutter, and now here comes the
9 important part, the part that springs, and there is the
10 elongated needle-holder. There's the retainer with the
11 bridging portion. It's gone through. It has a sliding
12 engagement.

13 And I believe the next limitation -- okay.
14 Sorry. I got ahead of myself.

15 So the next limitation says, said sliding
16 engagement producing a holding force -- remember, that's
17 that holding force, frictional holding force -- in
18 opposition to the retraction force applied to the holder
19 by the spring.

20 Q. And, again, we looked at this with respect to
21 the '224 patent, but just briefly, is this Mr. Shaw's
22 explanation of how to obtain that holding force?

23 A. Absolutely. Once again, a simple,
24 straightforward, clear inventor's description of, hey,
25 let's make the inner piece have a slightly greater

1 diameter than the outer piece, and as a consequence,
2 we're going to create a frictional holding force. It --
3 he speaks the truth.

4 Q. Now, is there any way for you, as a scientist,
5 to test the amount of friction present? You've said
6 that the friction's present because these things are an
7 interference fit.

8 A. Uh-huh.

9 Q. Is there a way to test that?

10 A. Sure. In a perfect world, you could -- if you
11 had something press fitted to something else, you could
12 use an Instron or some other kind of testing device, and
13 you could measure how much force there is, and you
14 could -- I could come up with a number, and I could say,
15 you know what? The frictional force there is 2.78
16 pounds.

17 But the problem is, if you recall in this 1ml
18 product, I acknowledged that there is a little bump
19 called the hub location ring. And so to be fair, part
20 of what holds that in place is not friction, but there
21 is a small mechanical contribution.

22 So how do I test that? I can't perform a
23 regular test and push the needle back -- let's say push
24 the needle into something hard and try to push it back,
25 because I would be measuring both the frictional force

1 and the mechanical force.

2 It's like you can't put two people on a scale
3 and weigh each of them. All you get is the total
4 weight. So what you have to do is whatever you can.
5 And because I was interested in getting a rough idea, a
6 ballpark amount of how much is friction force, even
7 though the claim and the Court's construction only
8 requires some frictional force, I performed some
9 testing.

10 Q. Now, did you do that testing -- why did you --
11 what caused you to do that testing?

12 A. Well, as an expert in plastics and medical
13 devices, I knew that the press fits -- just like
14 Mr. Shaw knew, that the press fits were going to be
15 adequate to provide the friction to hold the needle in
16 the -- in the proper position.

17 However, the expert for BD, during his
18 deposition, made some comments -- not comments -- he
19 made statements that just were not in his report. We --
20 all experts are required to write reports and things,
21 and then we get --

22 MS. PIROZZOLO: Your Honor, may we
23 approach?

24 THE COURT: Very well.

25 (Bench conference.)

1 MS. PIROZZOLO: I don't think questions
2 of that character --

3 THE COURT: Yeah. I don't know if it's
4 appropriate.

5 MR. HARDIN: Okay. When we're past --

6 THE COURT: Yeah. I'll sustain it.

7 (Bench conference concluded.)

8 Q. (By Mr. Hardin) Mr. Sheehan, for purposes of
9 today, you did -- you looked at it and concluded, as an
10 engineer, you thought it was frictionally fit?

11 A. Yes, sir.

12 Q. And then you did some tests later?

13 A. And then I was prompted to do some testing.

14 Q. Okay. So explain what tests you did.

15 A. Okay. In order to test how much of the force,
16 the total force, was frictional or how much friction
17 force was there, I disassembled 10 -- no, 20, I think --
18 20 1mL Integra syringes that were given to the attorneys
19 for RTI by BD. You know, it's a BD product.

20 And I took them apart. I took the springs
21 out, and I measured the force that the spring was
22 pushing, because the limitation talks about how much --
23 you see -- you see up top, it says the needle-holder by
24 the spring.

25 So I wanted to compare, well, okay, how much

1 is the force -- the spring pushing and how much friction
2 is there coming back the other way.

3 So I took 20 of them apart, and I measured --
4 I took 20 springs, and I measured them on a little
5 fixture that kept them corralled as if they were inside
6 that cutter, as you saw. Excuse me.

7 And I squeezed it down to the exact height
8 that they were in the actual product, which is
9 400,000ths tall, 400,000ths of the length, and the
10 average force at the spring generated was .0735 pounds,
11 which is about a little over an ounce.

12 So you think of a postal scale, you think of
13 kind of a fat letter that weighs an ounce, that's about
14 how much that spring was -- is pushing back. It's about
15 a 1 ounce, 1.1 maybe ounce of spring.

16 So now I know how much force the spring is.
17 So now comes the hard part. How am I going to figure
18 out the friction part?

19 So we better take a look at the next slide,
20 and we better progress it one more.

21 I took those 20 pieces -- remember, I took the
22 springs out. Then in doing so, I took the needle and
23 the needle-holder -- I took all of that out the back
24 end. That's the only way you can get it out. It has to
25 go out the back end. I didn't want to fire any of

1 these.

2 Now, I then put them back in. I took the
3 cutter out, because I didn't want any of these things to
4 be cut. So I took the cutter out, and this particular
5 picture shows -- you can still see a spring in there,
6 but this is just for demonstration, and then I'll tell
7 you about it in a second.

8 Thank you.

9 But what I did is -- now, I -- this -- I'm
10 sorry. The syringe is pointing to the right this time,
11 okay? Yeah. I'm sorry. We turned it around on you.
12 See this black line here? That's a -- that's a
13 marker on the -- that's a black ink line on the actual
14 syringe saying that's where zero is, and this is a
15 little marker, and there's a whole bunch of them with
16 numbers.

17 This is that location ring. I pushed the
18 retainer needle-holder piece forward of that, because
19 this diameter is the same as this diameter. So I'm
20 getting a good -- an accurate test.

21 And I measured the force required to push on
22 this end of the needle, which I cut off carefully so
23 that I wouldn't get poked by the pointing needle, and we
24 just pushed on it using -- and when I say we, I used
25 some technicians at RTI using the same equipment that

1 they do their FDA required testing with.

2 And we pushed on it and got measurements an
3 average of 1.33 pounds. Now, that's about 18 times
4 stronger than the spring. But that's not really the
5 whole story.

6 Q. So I can understand, the spring is -- the
7 spring is -- when the spring is in there, the spring is
8 pushing up at about an ounce?

9 A. About 1.1 ounce, a little over that.

10 Q. Okay. And when you tried to push this further
11 out, you got 18 times?

12 A. About 18 times.

13 Q. Okay. So it's 18 times the force?

14 A. Right. So -- so -- so the retainer -- the
15 friction holding the retainer in -- in this modified
16 position -- and I'll explain why it's modified in a
17 second -- was already 18 times stronger than the spring.
18 But that wasn't enough. You see, there's a gap right
19 there. You see that gap right there (indicating)?
20 Well, that's because this location ring is no longer
21 there.

22 I wanted to be able to measure what is the
23 friction force without the mechanical contribution of
24 the location ring. I'm trying to subtract it out.

25 Q. So -- so -- so the -- the actual retainer ring

1 has a groove in it?

2 A. The retainer ring -- the retainer ring -- I'm
3 sorry. The location ring on the barrel sticks in.

4 Q. Okay.

5 A. And there's a groove on the retainer ring --
6 retainer member --

7 Q. Right.

8 A. -- that matches up with it. That was those --
9 that's when the red and the blue things lined up in that
10 earlier big picture.

11 Q. And so you pushed it further into the barrel
12 so that the bump was no longer in that groove?

13 A. Exactly.

14 Q. Okay. And then that let you just measure what
15 the friction was on the wall without having the added
16 holding force of the bump in your measurement?

17 A. What it did was, it allowed me to measure the
18 holding force without the mechanical part, but at the
19 same time, I lost the press fit at that location ring.
20 So 40 percent of the number is missing. If there were
21 no location ring, this would be dead flat, and this
22 number would be over 2 pounds.

23 Q. Okay.

24 A. So because of this, I measured a -- a
25 compromised version. 40 percent of it is missing

1 axially in length. So this number you really kind of
2 divide this or you factor it --

3 MS. PIROZZOLO: Your Honor, may we
4 approach?

5 THE COURT: Yes.

6 (Bench conference.)

7 MS. PIROZZOLO: There's nothing about
8 this in his report.

9 MR. HARDIN: Well, he issued a
10 supplemental report, and she came and took his
11 deposition specifically on the supplemental report, Your
12 Honor.

13 THE COURT: Well, I mean, is any of this
14 information in the supplemental report about this
15 testing? I don't --

16 MR. HARDIN: The testing, that was the
17 supplemental report.

18 MS. PIROZZOLO: That's not his
19 characterization that he's talking about now.

20 MR. HARDIN: Well, she took his -- we
21 all --

22 THE COURT: You took his deposition after
23 he gave the report and had all this testing in it?

24 MR. HARDIN: Yes, sir.

25 MS. PIROZZOLO: But he didn't talk about

1 this relative force that he's talking about.

2 MR. HARDIN: She didn't ask him the right
3 questions, but all of this is in the report, Your Honor.

4 THE COURT: Well, I'm going to -- if
5 it -- if you represent it's in the report, I'm going to
6 allow it, and obviously, you can take this up
7 post-trial, and if it's not in the report, you can file
8 a motion based on that.

9 So --

10 MR. HARDIN: Okay.

11 THE COURT: -- I'm going to allow you to
12 go forward based on that representation.

13 MR. HARDIN: All of the data that we're
14 seeing on it was in his report, and Counsel came to take
15 his deposition on that report and asked all the
16 questions they pleased.

17 MS. PIROZZOLO: I would just add, the
18 data was in the report, but it's my understanding that
19 experts are supposed to disclose their opinions in
20 reports when they conduct testing.

21 THE COURT: Well, I mean, it looks like
22 you had the opportunity to depose him on the testing.
23 Did you not ask him whether he had formed any opinions
24 as a result of --

25 MS. PIROZZOLO: I did that, but he did

1 not answer --

2 THE COURT: Well, you're certainly
3 entitled to cross-examine him at length.

4 But does this have an end?

5 MR. HARDIN: Yes. Pretty quickly, Your
6 Honor.

7 THE COURT: Well, let's wrap it up.

8 (Bench conference.)

9 Q. (By Mr. Hardin) Mr. Sheehan --

10 A. Yes, sir.

11 Q. -- so I know you were very interested in this
12 report, because you're an engineer.

13 A. Yes, sir.

14 Q. Can you summarize the report, can you
15 summarize your conclusions for us, please?

16 A. Yes, sir. That even in this handicapped
17 position, because there's a part missing, and there's
18 also silicone that's been contaminating that, that
19 the -- the force should be more along the lines of
20 between 2 and 3 pounds.

21 Q. All right. And why was that conclusion
22 important again? We might have lost that since we --
23 because we -- since we went into the test.

24 A. Oh, because what I was trying to do is measure
25 how much force was friction --

1 Q. All right.

2 A. -- was attributable to the press fit
3 interference friction and discount any mechanical
4 contribution, however worthy, that was contributed by
5 the locating ring.

6 Q. And does that mean that this Element K of this
7 claim, in your opinion, is present in that device?

8 A. Absolutely.

9 Q. Okay. Let's move to the next element.

10 A. Oh, I'm sorry.

11 Q. K -- L.

12 A. Oh, okay. Yes. Sorry. Here simply the
13 plunger is depressed. We'll do a first position, and
14 this is a first position. Now it's squirting out. This
15 is an H1N1 vaccine. And that's all it has to do. It
16 has to be able to do that.

17 Q. Okay.

18 A. Yes.

19 Q. So that limitation is present, also?

20 A. That's right.

21 Q. All right. And finally, M?

22 A. And I think we have a finally here.

23 Q. Right.

24 A. Finally, a retraction position. Once again,
25 just like we've seen similarly, after you come to that

1 first position where you've expelled all the flu vaccine
2 into the patient, it goes on to -- forward to an
3 additional position. This moves through the transition
4 zone right here.

5 And you'll see this move through that little
6 orange area, and it releases the needle-holder -- that's
7 this part (indicating) -- from the retainer member,
8 which, of course, is a non-retractable part, and
9 essentially, the force becomes less than the retraction
10 force on the needle.

11 In other words, it lets -- it lets the
12 spring -- gets out of the way, lets the spring whoosy --
13 whoosy -- as it is, do its job. And so we'll see that
14 happen right now.

15 And you've seen this before. We're going to
16 zoom in on it, and you see the plunger in sort of a
17 lavender color push on the red part. It slides forward,
18 and the cutter, it cuts. The non-retractable part stays
19 up in the front, and the retractable part goes back,
20 being released from the frictional hold.

21 Q. So is it your conclusion that the 1ml syringe
22 has all of the requirements of Claim 1 of the '733
23 patent that Mr. Shaw obtained?

24 A. It is my opinion, yes.

25 Q. Okay. The last claim we're asserting, Claim

1 24 in this patent.

2 A. Yes, sir.

3 Q. Okay. This is a method of assembly. And we
4 have a lot of the same terms, so we're going to try to
5 go through this fairly quickly.

6 Is it fair to say that this is a method of
7 assembly that describes how all the things are loaded
8 into the 1ml syringe?

9 A. Precisely. And here's a drawing from BD
10 showing exactly that.

11 Q. Okay. So let's move through the first part of
12 this claim.

13 A. Providing a one-piece hollow syringe body.
14 Familiar. We've already seen this. And instead of
15 watching the movie, you get to see the still at the end.
16 So that's met.

17 Q. Right.

18 A. Now, comprising an elongated barrel in a nose
19 portion of reduced cross-sectional area relative to the
20 barrel.

21 And what we see here is exactly what we saw in
22 the other limitation regarding the structure, is that we
23 see -- we -- we see that the diameter out here is bigger
24 than all the diameters in there. So it's a reduced
25 cross-section.

1 Q. Okay. Next.

2 This is the inwardly facing surface in the
3 wall at the most constricted part of the transition zone
4 between the barrel and the nose where the nose begins.

5 Same as we saw before?

6 A. Same as we saw before. And that's why I had
7 inwards facing surface on the other earlier slide,
8 because now you can appreciate exactly where it is.
9 It's right there. So it's where the red part is
10 frictionally sealed against.

11 Q. Okay. Next. This is the same slide for the
12 same purpose, just showing what it means.

13 A. Exactly.

14 Q. Okay. What's the next?

15 A. Providing a plunger assembly having a front
16 portion and a back portion, front portion, including the
17 head, configured for a sliding contact with the interior
18 of the barrel.

19 It just means that this part here seals.

20 Q. Okay. What's next?

21 A. Let's move on to F.

22 Said head -- that means the head that we've
23 mentioned before -- having a retraction cavity and a
24 leading end.

25 We saw the retraction cavity in that still.

1 We saw the leading end. And now we're going to see --
2 here's a retraction cavity, and when it gets activated,
3 all this stuff goes up into the retraction cavity.

4 Q. Okay. And that's mounted in the nose?

5 A. Correct.

6 Q. Okay. Next.

7 A. G, providing a needle-holder having an
8 elongated body portion.

9 Well, let's take a look at this. Here's our
10 elongated body portion. Some arrows will come in and
11 show this. There's a needle-holder. This is the
12 elongated body portion. There's the fluid path, and
13 we're out.

14 Q. Okay.

15 A. And that's pretty much it.

16 Q. Okay. H?

17 A. H. Just a little more detail. The head of
18 the needle-holder having a retainer member.

19 There's the retainer member, and here's the
20 bridging portion. Here's the gap underneath the
21 bridging portion, which can be separated from the
22 needle-holder by contact with the leading end of the
23 plunger.

24 So when the plunger comes down and pushes
25 this, it permits the separation of this and this at the

1 bridging portion.

2 Q. Okay.

3 A. That's met.

4 Q. Okay. Next.

5 A. Oh, the reason we're looking through this is
6 because a retainer member is a Court claim construction
7 item. So very briefly, we're going to look right here
8 where it shows the press fit, which is where the
9 friction is.

10 And remember, the retainer member definition
11 by the Court says some friction or clamping at this
12 area.

13 Q. Okay.

14 A. And here you see the familiar pictures.

15 Q. All right. Next element.

16 A. Moving along -- this is a little -- well, here
17 we go again. The retainer member having an outwardly
18 facing surface configured to slidably and frictionally
19 engage the inwardly surface.

20 So you've got an outward surface facing an
21 inward surface and the nose against the retraction force
22 of the spring.

23 So we can blow right through this, because
24 this is exactly the same that was in the apparatus
25 claim, the structure claim. This is in the method

1 claim.

2 I tested the springs. I tested the force --
3 or the frictional force to the extent I could. It came
4 out 1.33 in a handicapped sort of way. The true fact is
5 it's between 2 and 3 pounds.

6 Q. Okay.

7 A. That limitation is met.

8 Q. Next element.

9 A. And this also addresses the at issue, which
10 has already been taken care of.

11 Q. All right.

12 A. Now, the bonus is, the last three get done at
13 once. This consists of loading the spring, followed by
14 the needle-holder into the back opening, positioning the
15 forward portion of the spring and a portion of the
16 elongated body of the needle-holder within the nose,
17 moving the head end of the needle-holder and the
18 retaining member into the most constricted part of the
19 transition zone where the nose begins -- remember,
20 that's that little orangy part -- and finally,
21 installing a needle-holder and retainer member in the
22 nose by sliding engagement -- that's that sliding press
23 fit -- go to the inward release -- or the outwardly
24 facing surface and the inwardly facing surface while
25 compressing the spring.

1 Now, all of those words, which are a lot of
2 words, occur in one animation, and you've seen it
3 already. So this will be old news. There's the front
4 end of the barrel coming down.

5 And you can see in the blueprint what's
6 coming, and here they come from the right again. You
7 see it again. There's the cutter. Here comes the
8 spring. It's coming more slowly than I'd like, but
9 there's the needle holder. There's the retainer
10 member, and that's a slide at the inwardly and
11 outwardly surface.

12 Inwardly surface -- an inwardly facing surface
13 and an outwardly facing surface are pressed against each
14 other in a sealing manner.

15 And all three of those limitations are met.
16 And all three of them get a green check.

17 Q. So is it your opinion that when this 1mL
18 Integra product is made by BD, that the method by which
19 it's manufactured is -- is the method that uses each and
20 every limitation of this Claim 24 of Mr. Shaw's patent?

21 A. It is.

22 Q. All right. Now, in addition to studying the
23 issue of whether or not these two products, this 3mL
24 Integra and the 1mL Integra, used Mr. Shaw's inventions
25 as we've -- as set forth in these claims, did you study

1 the matter of whether or not, in your opinion from
2 documents you saw from BD files, the engineers copied
3 some of these features in their product?

4 A. Yes, it is my belief that they did.

5 Q. Okay.

6 A. And the documents support that.

7 Q. And you're basing your belief based on --
8 you're basing your opinion based on documents you saw
9 from internal BD sources?

10 A. That's correct.

11 Q. Did you review any of the BD engineer
12 depositions?

13 A. Yes, I did.

14 Q. Okay. Now, we heard in opening that BD is
15 claiming they're using a cutter technology that they
16 purchased and not the Shaw technology.

17 Is BD using the technology they purchased from
18 Saf-T-Med?

19 A. No, they are not.

20 Q. So what's the basis of that?

21 A. Well, they're using a cutter, but they are not
22 using the cutter technology disclosed in the McGary
23 patent, which was purchased by BD.

24 Q. What makes you say that?

25 A. Because the essence of the McGary patent is

1 that the seal on the front end of the plunger moves
2 longitudinally and relative to the plunger. It slides
3 back on it in order for the cutter to appear. Not in
4 order to; in conjunction with it.

5 So whereas they do use a cutter, they do not
6 use what I would term the cutter technology of the -- of
7 the McGary '010 patent that they purchased.

8 Q. Okay. Do you know from your study of these
9 engineering drawings whether or not BD used even one
10 single part of the Saf-T-Med design that they purchased?

11 A. Based on my study, they didn't use one single
12 part.

13 Q. Okay. Do you know whether BD considered
14 Shaw's patented technology before purchasing Saf-T-Med?

15 A. Yes, I know that they did.

16 Q. Now, did you see documents that indicated what
17 BD thought of Mr. Shaw's technology at the time he
18 submitted it?

19 A. Yes. I have a recollection that they were
20 impressed with it. I think that they said something
21 along the lines it was the best version of this type of
22 technology, something along those lines. It's in the
23 document.

24 MR. HARDIN: Can we see Exhibit 87,
25 please?

1 Q. (By Mr. Hardin) Is this the document you're
2 referring to?

3 A. I think so. It will have to be zoomed in for
4 me.

5 Q. It is felt that neither of these technologies
6 could be produced to lower cost in a SafetyGlide combo
7 or a Safety-Lok combo. And a significant R&D and
8 capital investment would be required to market such
9 products unless either of these products was seen to be
10 significantly more attractive in the marketplace, it
11 doesn't seem like either is worth pursuing further,
12 given the typical retractable technology drawbacks,
13 although these both are some of the best embodiments of
14 the concept.

15 A. Right. That's the section I was recalling.

16 Q. Okay. Did BD ask for samples of Mr. Shaw's
17 product?

18 A. Yes, they did.

19 Q. What was the purpose of obtaining the samples
20 from Retractable as far as you can tell -- or the
21 internal documents show that BD did with those samples?

22 A. What they actually did was they did
23 comparative testing.

24 MR. HARDIN: Can I see Exhibit 4?

25 Q. (By Mr. Hardin) Is this the document you're

1 referring to about comparative testing?

2 A. I believe it is. It's a little hard -- I'd
3 have to have the zoom-in.

4 Q. It says: On Monday --

5 A. Yes.

6 Q. -- July 28th, a brief discussion about the
7 VanishPoint retractable syringe took place. Discussion
8 focused on what competitive product testing is to be
9 done with the limited amount of samples that we have.

10 A. There it is.

11 Contrary to evaluating them in terms of, gosh,
12 maybe we should do some business here, what it is it
13 turned out to be is just a competitive analysis and
14 let's see what our competitor is up to.

15 Q. Now, did BD engineers just slavishly copy
16 Mr. Shaw's design?

17 A. Of course not. That would be too obvious.

18 MR. HARDIN: Can I see Exhibit 138,
19 please?

20 Q. (By Mr. Hardin) Does this document indicate
21 anything to you about what the BD engineers were doing
22 with the technologies that they looked at in order to
23 create the Integra?

24 A. Yes. It describes it precisely.

25 If we can zoom in on the first one -- or I'll

1 read it.

2 Identify strengths and weaknesses of the
3 Saf-T-Med design and competitive product, VanishPoint
4 and Zero-Stik.

5 So they're looking at -- they're comparing the
6 Saf-T-Med design, which is the one that they essentially
7 purchased, and VanishPoint, which is the RTI product,
8 Mr. Shaw's product, and then another product, Zero-Stik
9 by a different manufacturer.

10 Q. Okay.

11 MR. HARDIN: Finally, can we take a look
12 at Exhibit 351?

13 A. There's Item 2.

14 Q. (By Mr. Hardin) Oh, I'm sorry.

15 A. And so bearing that in mind, the idea was
16 let's develop a hybrid design that incorporates the
17 strengths and eliminates the weaknesses of the Saf-T-Med
18 design.

19 So here's a straightforward acknowledgement
20 that they're going to be importing things from -- from
21 the VanishPoint, which is the commercial embodiment of a
22 number of these patents.

23 Q. And that importation, in your view, caused
24 their product to be described by the claims we've just
25 went through with the jury?

1 A. That's exactly right. They Shaw-ized them.

2 Q. Finally, let's take a look at Exhibit 351.

3 This is another BD internal document?

4 A. Yes, sir.

5 Q. And does this show the entire -- what are we
6 seeing there? Are we seeing the entire syringe or just
7 pieces of the syringe?

8 A. No. What we're looking at here are just the
9 plunger portions. And the upper one is the RTI product;
10 next is the Saf-T-Med product, and down below is the BD.
11 And I think this is the 3ml. We're back into the 3ml
12 land.

13 And what you can see is that the Saf-T-Med has
14 a collapsible plunger. See those little -- it says
15 breaking tabs there? What that means is in order for
16 this to work, you have to break those tabs and collapse
17 the plunger. And that's why there is a limitation.
18 Remember, there was limitation in a number of the claims
19 saying wherein the seal on the end of the plunger cannot
20 move longitudinally.

21 Q. That's Mr. Shaw's claims.

22 A. Those are Mr. Shaw's claims, right.

23 And this -- this is how the Saf-T-Med product
24 worked, which is related to McGary and Jensen.

25 Q. But the last one on the page is BD; just says

1 BD.

2 Is that a picture of the 3ml plunger?

3 A. That's the 3ml plunger, yes.

4 Q. And does it have a stopper that slides back?

5 A. No, it doesn't. It has a fixed stopper just
6 like RTI.

7 MR. HARDIN: Your Honor, may I approach
8 the bench?

9 THE COURT: Yes. Approach, please.

10 (Bench conference.)

11 MR. HARDIN: In connection with the
12 Daubert motions, we had in Dr. Hyman's report
13 information about what we considered to be product
14 defects, that they had essentially made this product in
15 a way that spoiled the market.

16 Mr. Sheehan had a whole set of similar
17 information. It was not a formal, however, Daubert
18 objection to that, and so Your Honor never ruled on
19 that.

20 But instead of proceeding forward on
21 that, when I know that it's been excluded by Hyman, I
22 need a ruling from Your Honor on that.

23 THE COURT: The ruling will be the same
24 on this witness as Dr. Hyman.

25 MR. HARDIN: So that will be excluded.

1 THE COURT: What would be the purpose
2 of -- I've never heard such a theory. What would be the
3 purpose of such a theory?

4 MR. HARDIN: Well --

5 THE COURT: I'd sort of like to hear.
6 The infringement did such a bad job, they --

7 MR. HARDIN: It's because they used a
8 hybrid, Your Honor. It's because, from a patent
9 standpoint, it shows that if you go very far away from
10 Mr. Shaw, you don't end up with a very good product.
11 That's the patent reason that -- variations away from it
12 show that he really got the formula right.

13 That's why we thought it was relevant,
14 the patents, without even an antitrust overtone. But
15 Your Honor has excluded it. I just need the ruling.

16 THE COURT: Is your position the same?

17 MS. PIROZZOLO: We understood it's
18 excluded. Yeah, so we don't see the relevance.

19 THE COURT: I tend to agree, so I'm going
20 to have the same ruling as to this witness as to Dr.
21 Hyman.

22 MR. HARDIN: We understand the ruling,
23 Your Honor. We will probably be making written offers
24 of proof.

25 THE COURT: Yeah. Okay. Very well.

1 But I understand you're offering this witness as not in
2 an anticompetitive -- not under an anticompetitive
3 theory but under what?

4 MR. HARDIN: No. Simply to demonstrate
5 that the non-obviousness of Mr. Shaw's designs -- in
6 other words, the -- the fact that he hit the nail on the
7 head, as demonstrated in part that if you -- if you vary
8 those designs even -- even slightly, which they did,
9 they didn't go outside his claims -- but if they added
10 other things, they ended up making a bad product.

11 MS. PIROZZOLO: But how does that go to
12 patent claims which have to be in our product?

13 MR. HARDIN: It doesn't go to
14 infringement at all. It goes to validity. It just
15 shows --

16 THE COURT: Very well.

17 MS. PIROZZOLO: Validity.

18 THE COURT: My ruling is going to be the
19 same.

20 MS. PIROZZOLO: Thank you, Your Honor.

21 (Bench conference concluded.)

22 THE COURT: How much longer do you expect
23 on direct?

24 MR. HARDIN: If Mr. Sheehan can sit down,
25 I just have one more question.

1 THE WITNESS: Great. Works for me.

2 Q. (By Mr. Hardin) Mr. Sheehan, you've worked in
3 this field for a long time.

4 A. That's correct, sir.

5 Q. And we heard in opening statement that BD
6 believes that because it has a cutter as an important
7 part of its products, that somehow they don't use
8 Mr. Shaw's inventions.

9 A. Yes, I've heard that.

10 Q. Having done this analysis and understanding
11 Judge Folsom's rulings here in this book --

12 A. Yes, I understand.

13 Q. -- what is your belief on that topic?

14 A. My belief is that it's irrelevant whether or
15 not a cutter is used at all.

16 Q. And, therefore, that you believe -- do you
17 believe that BD has, in fact, used Mr. Shaw's inventions
18 as set forth in these claims?

19 A. Absolutely. Even if the cutter is an integral
20 or a necessary or an important part of the product,
21 nonetheless, remember the comprising language. The 1mL
22 and the 3mL BD Integra syringes infringe each and every
23 one of those claims that I walked through.

24 MR. HARDIN: Okay. We have no further
25 questions for this witness.

1 THE COURT: Why don't we take a short
2 break before cross-examination, not quite as long as we
3 normally would, since we've already taken a short break.

4 We will be in recess for 10 or 15 minutes
5 at most.

6 COURT SECURITY OFFICER: All rise.

7 (Recess.)

8 COURT SECURITY OFFICER: All rise.

9 (Jury in.)

10 THE COURT: Please be seated.

11 Cross-examination.

12 CROSS-EXAMINATION

13 BY MS. PIROZZOLO:

14 Q. Good afternoon, Mr. Sheehan.

15 A. Good afternoon.

16 Q. Now, I think you just said that the cutter in
17 the Integra syringes is irrelevant.

18 A. Irrelevant to the infringement issue.

19 Q. If you took the cutter out of the Integra
20 syringes, they wouldn't work, would they?

21 A. Actually, in the 3ml, it's true, it wouldn't
22 work. In the 1ml, though, I believe it does work.

23 Q. The 3ml, it wouldn't work, correct?

24 A. I'm pretty sure the 3ml wouldn't work, right.

25 Q. And the 1ml, you don't know if it would work?

1 A. No. I'm sorry, ma'am. I think I said that I
2 believe it does work. I've made it work.

3 Q. Now, is it normal and customary for a company
4 to keep abreast of its competitors' products?

5 A. Yes.

6 Q. We looked at a document from June 1997 where
7 BD had VanishPoint syringes, correct?

8 A. Yes.

9 Q. Okay. VanishPoint syringes were public and
10 being sold at that time, correct?

11 A. That is my understanding, yes, ma'am.

12 Q. Now, Mr. Sheehan, many syringes have a barrel,
13 correct?

14 A. Yes, ma'am.

15 Q. RTI was not the first to patent its syringe
16 with a barrel, correct?

17 A. Correct.

18 Q. Many syringes have a plunger, correct?

19 A. Yes, ma'am.

20 Q. RTI was not the first to patent a syringe with
21 a plunger, correct?

22 A. Yes, ma'am.

23 Q. Many -- the plungers in many syringes have a
24 seal at one end, correct?

25 A. Yes, ma'am.

1 Q. RTI was not the first to patent its syringe
2 plunger with a seal at one end, correct?

3 A. No. Not as you describe it, no.

4 Q. The plungers in many syringes have a thumb
5 cap, correct?

6 A. Yes, ma'am.

7 Q. RTI was not the first to patent a syringe with
8 a thumb cap, correct?

9 A. That's correct.

10 Q. Many syringes have a needle, correct?

11 A. Yes, ma'am.

12 Q. And I think you said vents also exist in the
13 prior art, correct?

14 A. That's correct.

15 Q. RTI was not the first to patent a syringe with
16 a vent, correct?

17 A. That's correct.

18 Q. Collars existed in prior art?

19 A. Yes, they did.

20 Q. And collars were even known to make -- to be
21 used to make the plunger inaccessible for grasping,
22 correct?

23 A. That's correct.

24 Q. Now, Mr. Sheehan, there are three patents
25 being asserted in this case?

1 A. Yes.

2 Q. Okay. And those are the '733 patent, the '224
3 patent, and the '077 patent?

4 A. Yes, ma'am.

5 Q. And all of them relate to automatic retracting
6 syringes, correct?

7 A. They do.

8 Q. And RTI was not the first to patent an
9 automatic retracting syringe, correct?

10 A. Correct. Yeah, sure.

11 Q. Now, you talked -- let me strike that.

12 Mr. McGary had filed a patent to a retractable
13 syringe before Mr. Shaw filed his patents, correct?

14 A. Mr. McGary and Mr. Jentzen, yes.

15 Q. Okay. And, in fact, there were many patents
16 to automatically retracting syringes before Mr. Shaw
17 filed his patents, correct?

18 A. Yeah. I believe I testified to that, yes.

19 Q. You also said that none of those designs were
20 made into a plastic object; is that right?

21 A. I think I said that none of them were made
22 into a product that reached the market and saved a life.

23 Q. Well, you've heard of a company called
24 Saf-T-Med, correct?

25 A. Yes.

1 Q. Okay. That is the company that was purchased
2 by BD, correct?

3 A. Yes.

4 Q. Okay. And Saf-T-Med had licensed the McGary
5 patents, correct?

6 A. That's correct.

7 Q. Okay. And Saf-T-Med made a retractable
8 syringe, correct?

9 A. Saf-T-Med made a retractable syringe that did
10 not see the market.

11 Q. Saf-T-Med obtained FDA approval for its
12 retractable syringe, correct?

13 A. Interestingly, no. What they received was FDA
14 clearance. There's a difference. Approval is something
15 you get when you go through the P&A process. It's a far
16 more rigorous process.

17 Clearance is what you get when you go through
18 the 510-K process, which is a shorter process, briefer
19 process, where the FDA looks over materials supplied by
20 the manufacturer, who swears and has to be truthful,
21 that my product is just as safe and effective as another
22 product that was approved -- cleared by the 510-K
23 process.

24 So with that clarification, next question.

25 Q. Saf-T-Med made a plastic object, an automatic

1 retracting syringe, correct?

2 A. Sure. Of course, they made a plastic object.

3 Q. And it was -- received clearance from the FDA,
4 correct?

5 A. Correct.

6 Q. Now, let's look at Exhibit -- Defendant's
7 Exhibit 78, please, which is the '733 patent.

8 Now, '733 patent is one of the RTI patents in
9 this case, correct?

10 A. Yes, ma'am.

11 Q. I want to turn to the page of the patent that
12 discusses the background of the art.

13 MS. PIROZZOLO: That's on the second page
14 of the patent.

15 Q. (By Ms. Pirozzolo) Okay. And in that section,
16 the patent -- the inventor described the background of
17 the art, correct?

18 A. That is the purpose of that section, yes.

19 Q. And at Column 1 in Lines 31 to 33, the patent
20 states, quote: There are a number of syringes of
21 different designs which have needles which will retract
22 at the end of the injection cycle, correct?

23 A. Yes, that's correct.

24 Q. Okay. And then the background section goes on
25 to point out certain problems with the prior art,

1 correct?

2 A. Sure. That's a fair statement.

3 Q. Okay. For example, at Column 1, Lines 48 to
4 52, the patent says: Other problems with the prior art
5 are dependence on flexing or breaking of internal parts
6 by the plunger in order to release the retraction
7 mechanism and use of a diaphragm at the end of the
8 plunger which must be penetrated by a needle-holding
9 member and spring, correct?

10 A. That's what it says, yes, ma'am.

11 Q. So that's what was identified as a problem
12 with earlier retracting syringes, correct?

13 A. Yes.

14 Q. Okay. The patent also says at Column 1, Line
15 54: Small broken-off pieces can present a risk of
16 hang-ups, correct?

17 A. Yes.

18 Q. So that was another problem with the prior
19 art.

20 A. (No response.)

21 Q. And at the conclusion of the section on
22 background of the art, the patent states, and this is at
23 Column 2, Lines 19 to 23:

24 The prior art has not recognized a retraction
25 mechanism with separable parts that relies entirely on

1 clamping force or friction at a smooth-walled reduced
2 diameter transition zone in the barrel with mating lands
3 which are slidably or separably released, correct?

4 A. Is your question does it say that?

5 Q. That's how --

6 A. It says that.

7 Q. Okay. Now, using cutting to release the
8 needle is not described in the RTI patents, correct?

9 A. The actual word cutting is not -- does not
10 appear.

11 Q. Now, the '733 patent, which we're looking at,
12 describes different syringe -- different embodiments of
13 the invention, correct?

14 A. Correct. Three, as I recall.

15 Q. Okay. And one of those embodiments is what
16 you have called a friction-based retraction mechanism,
17 correct?

18 A. That's a fair statement, meaning friction and
19 friction, yes.

20 Q. Yes.

21 A. The first embodiment.

22 Q. The term you used was friction-based
23 retraction mechanism, correct?

24 A. You mean here or in my deposition?

25 Q. In your expert report.

1 A. Oh, okay. Fine. Yeah.

2 Q. And in that mechanism, the spring force is
3 released by sliding disengagement of the needle holder
4 and the wall of the syringe, correct?

5 A. Say that again.

6 Q. In the friction-based mechanism, the spring
7 force is released by sliding disengagement -- I'm
8 actually using your words from your expert report -- of
9 the needle holder and the wall of the syringe, correct?

10 A. Yes, that's fine.

11 Q. Okay. Now, RTI's commercial product, the
12 VanishPoint, uses that embodiment, correct?

13 A. Yes. The RTI VanishPoint product line uses
14 the first embodiment.

15 Q. Okay. You don't contend the Integra syringes
16 use that embodiment, correct?

17 A. No, I do not.

18 Q. Okay. So the Integra syringes do not use the
19 embodiment that you say the VanishPoint syringes use,
20 correct?

21 A. In which -- which -- which patent?

22 Q. I'm talking about the friction-based
23 embodiment, okay? That's used by the VanishPoint, but
24 not by Integra, correct?

25 A. Separate of any claims, you're just saying the

1 embodiment?

2 Q. Yes.

3 A. Okay. When it comes to just the embodiment,
4 sure. That is -- the first embodiment is not the
5 embodiment that BD practices. They practice the third
6 one.

7 Q. Okay. So the Integra syringes don't use the
8 same retraction mechanism as the VanishPoint syringes,
9 correct?

10 A. Define retraction mechanism.

11 Q. Friction-based retraction mechanism.

12 A. No, they use friction.

13 Q. Well, the friction-based embodiment in the
14 patent is not used by BD, correct?

15 A. Excuse me. It's a semantic term, but there is
16 friction in -- in all three embodiments.

17 Q. Okay. But when we were talking before, you
18 said there were three embodiments.

19 A. Uh-huh.

20 Q. And one of them you described as the
21 friction-based retraction mechanism, correct? That's
22 how you described it in your report?

23 A. Regardless of how I described it in my report
24 as a -- for a shorthand, the fact of the matter is that
25 the first embodiment is friction and friction.

1 The second embodiment is just friction.

2 The third embodiment is friction and bridging.

3 And it's the third embodiment that BD uses.

4 Q. Okay. VanishPoint uses friction and friction,
5 correct?

6 A. Correct.

7 Q. BD doesn't use that, correct?

8 MR. HARDIN: Your Honor, I think we are
9 using a product-to-product comparison now. I think
10 that's inappropriate.

11 THE COURT: I sustain the objection.

12 Q. (By Ms. Pirozzolo) Now, you also talked during
13 your direct testimony about the bridging portion
14 embodiment, correct?

15 A. Yes, ma'am.

16 Q. Okay. RTI's VanishPoint doesn't use the
17 bridging portion embodiment, correct?

18 A. That's correct.

19 Q. So RTI's VanishPoint doesn't practice the
20 claim with the bridging portion that are being asserted
21 against BD in this case, correct?

22 A. That's correct.

23 MR. HARDIN: Your Honor, same objection.

24 THE COURT: Sustained.

25 Approach the bench, both of you.

1 (Bench conference.)

2 THE COURT: Where are you going with this
3 line of questioning?

4 MS. PIROZZOLO: Well, this is relevant to
5 the nexus between the patent claims and the success of
6 the invention. They're claiming that VanishPoint is a
7 terrific invention, and it solved a long-felt need.
8 Well, the nexus is the between --

9 THE COURT: So you're going to the nexus
10 issue?

11 MS. PIROZZOLO: Yes.

12 MR. HARDIN: But, Your Honor, she keeps
13 talking about her product and our product. It has this
14 and this doesn't have that.

15 THE COURT: Yeah, it's almost like you're
16 comparing the two products. So why don't you rephrase
17 the question in the terms of the nexus and see where
18 that leads us.

19 MS. PIROZZOLO: Well, I think I don't
20 need to ask any more questions on that.

21 MR. HARDIN: All right. As long -- that
22 solves it, too.

23 THE COURT: That solves that.

24 (Bench conference concluded.)

25 Q. (By Ms. Pirozzolo) Mr. Sheehan, you talked

1 about Figure 8 in your direct examination, correct?

2 A. Yes, ma'am.

3 Q. I'd like you to look at Figure 8 and walk
4 through the portions of Figure 8.

5 Now, I've colored Figure 8 just for ease of
6 reference. Do you agree that the gray color is the
7 barrel in Figure 8?

8 A. No, ma'am.

9 Q. Okay. What is this portion here (indicates)?

10 A. The entirety of it is the body. What you can
11 see there is the nose and then eventually the transition
12 zone as it leads to -- as it goes north.

13 Q. So this is the --

14 A. So the barrel is further back.

15 Q. This is the wall of the syringe?

16 A. Well, now you're kind of pulling there.

17 I have no problem with that being described as
18 an outer wall of the syringe body. It has a particular
19 name in the patent.

20 Q. Okay. And this blue portion is the retainer
21 member in Figure 8, correct?

22 A. That's correct.

23 Q. Okay. And the yellow portion is the needle
24 holder, correct?

25 A. That's correct.

1 Q. And Figure 8 shows the needle holder and the
2 retainer member as two separate pieces joined by a
3 bridging portion, correct?

4 A. That's correct.

5 Q. Now, in Figure 8, there's a frictional hold
6 between the blue retainer member and the wall of the
7 syringe, correct?

8 A. That's correct.

9 Q. And during retraction in the Figure 8
10 embodiment, that friction is released, correct?

11 A. It is released from -- from holding the needle
12 holder so that it can -- the needle holder can retract.

13 Q. Well, it's also released from the retainer
14 member, correct?

15 A. Ask me the question again.

16 Q. We're talking about the retainer member --

17 A. Sure.

18 Q. -- right?

19 A. Sure.

20 Q. You said there's friction between the retainer
21 member and the wall of the syringe.

22 A. Yes.

23 Q. And during retraction, in the Figure 8
24 embodiment, the frictional force between the retainer
25 member and the wall of the syringe is released, correct?

1 A. It is released from -- from the needle holder.

2 Q. Well, I'm talking about the retainer member,
3 so if you could focus on that, please.

4 You said there's friction right at this
5 location (indicates) --

6 A. Sure.

7 Q. -- between the retainer member and the wall of
8 the syringe.

9 During operation --

10 A. Uh-huh.

11 Q. -- in the embodiment shown in Figure 8, the
12 friction between those two pieces is released, correct?

13 A. Well, to the -- to the extent that that piece
14 slides, it overcomes it. Sure.

15 Q. So the friction is released, correct?

16 A. Well, it's mollified, attenuated.

17 Q. Released? Sir, is the friction force between
18 --

19 A. No, no. I -- I understand. It's just you're
20 asking a question that's not one of those yes or no
21 questions.

22 So -- so the friction that's between the
23 retainer member and the wall, while it -- it still
24 remains to some degree, it -- it is reduced by virtue of
25 the fact that the retainer member is slid.

1 So is that releasing?

2 Q. Well, the retainer member slides forward --

3 A. Yeah.

4 Q. -- during retraction.

5 A. Yeah.

6 Q. So the retainer --

7 A. And that's -- that's the point I was trying to
8 make, and I felt that you may have been blocking me from
9 doing that. And I just wanted to be clear that the
10 retainer member moves down by virtue of the plunger, the
11 front end of the plunger pushing it that way.

12 Q. So when it moves down, there's some change in
13 the frictional force there, correct?

14 A. Sure.

15 Q. Now, you asserted patent claims set forth
16 RTI's invention, correct? The ones that are being
17 asserted in this case.

18 A. That's correct.

19 Q. And the asserted patent claims, as you've gone
20 through in great detail, set forth very specific
21 elements of the invention, correct?

22 A. Yes. Like any claim, there are very specific
23 elements, sure.

24 Q. And to find infringement, you have to find
25 each and every element of those claims in the accused

1 product, correct?

2 A. Absolutely.

3 Q. So if a single element is missing, there can
4 be no infringement, correct?

5 A. That is correct.

6 Q. Okay. Now, the asserted claims of the '733
7 patent all require a, quote, retainer member, correct?

8 A. '733 is either container member -- or retainer
9 member or continuous retainer member. I'm not sure.

10 Q. Okay. And all the claims of the '224 patent
11 also include the requirement of a retainer member,
12 correct?

13 A. In one form or another.

14 Q. Okay. Now, I want to focus very closely on
15 the retainer member requirement of the claims, if we
16 can.

17 A. Sure.

18 Q. I'm going to put up the Court's claim
19 construction of retainer member.

20 So under the Court's construction, retainer
21 member is a non-retractable part of the retraction
22 mechanism that uses some clamping or frictional force to
23 keep the needle in the projecting position until that
24 clamping or frictional force is released, correct?

25 A. Yes, ma'am.

1 Q. So there are two components to that
2 definition, correct?

3 A. Well, there are more than two.

4 Q. Okay. Well, I want to focus on the two, in
5 particular, retainer member has to use some clamping or
6 frictional force to keep the needle in a projecting
7 position, correct?

8 A. In the projecting position, yes.

9 Q. And it has -- that clamping or frictional
10 force has to be released in retraction, correct?

11 A. Correct.

12 Q. So in order to find infringement, you have to
13 find both that friction and holding a needle in a
14 projecting position, and that the clamp, being a
15 frictional force, is released upon retraction, correct?

16 A. You have to find that the clamping or
17 frictional force is released from holding the needle in
18 a projecting position.

19 Q. Okay. Well, you have to find the retainer
20 member is released, correct?

21 A. No. No. The retainer member is a
22 non-retractable part. That's the outer part that does
23 not retract. That's a very key part here. The
24 non-retractable part is the retainer member.

25 MS. PIROZZOLO: Can we go back to

1 Figure 8, please?

2 Q. (By Ms. Pirozzolo) So I think we just went
3 over it, and we decided that in the Figure 8 embodiment,
4 the retainer member -- the frictional force between the
5 retainer member and the wall changes during retraction,
6 because the retainer member moves, correct?

7 A. There's nothing wrong with that statement.
8 Sure.

9 Q. Now, let's go to some basics on the 3mil
10 Integra syringe, okay?

11 A. Sure.

12 MS. PIROZZOLO: Could you put up
13 Defendant's Exhibit 312, No. 8?

14 Q. (By Ms. Pirozzolo) That is a BD 3mil Integra
15 syringe, correct?

16 A. I can't verify the photograph. It certainly
17 appears to be. I can't see the numbers, so I'm going to
18 have to take your word for it.

19 Q. You can look at it on the screen, if that
20 would be easier for you.

21 A. No. I'm just saying I can't see the numbers.

22 Q. You can't tell if that's a 3mL Integra
23 syringe?

24 A. My best guess is that it is, because I have
25 one here and it kind of looks about the same scale.

1 Q. Okay.

2 A. I just want to be thorough.

3 Q. All right. You have one in your hand you
4 said?

5 A. I do.

6 Q. Okay. Can you show the jury how the needle
7 assembly can come on and off the barrel of the Integra
8 syringe?

9 A. Well, the needle assembly actually doesn't
10 come on and off the barrel. Part of the barrel is
11 the -- is incorporated into the needle assembly.
12 So with that caveat and that correction, you can
13 unthread this just like this. So you have this part of
14 the barrel. The darker blue is the other part of the
15 barrel where I was trying to show the thread. And then
16 this lighter part here that kind of bling-blings here,
17 this is the retainer member.

18 Q. And that's a detachable needle assembly on the
19 Integra syringe, correct?

20 A. That's correct, yes.

21 Q. Okay. And the asserted RTI patents don't
22 disclose a detachable needle assembly, correct?

23 A. Correct. It's not a limitation.

24 MS. PIROZZOLO: Now, I want to go to
25 Defendant's Exhibit 312, No. 55.

1 Q. (By Ms. Pirozzolo) That's a picture of the
2 Integra 3mL needle assembly, correct?

3 A. Well, the terminology, needle assembly, might
4 be BD's, but that also is showing the one portion of the
5 two-part, two-piece barrel. The dark blue part is part
6 of the barrel.

7 Q. And that part has four different pieces in it,
8 correct?

9 MS. PIROZZOLO: And if we could go to
10 Defendant's Exhibit 312, No. 56.

11 Q. (By Ms. Pirozzolo) There's a needle, correct?

12 A. There is a needle, correct.

13 Q. It has a -- there's a spring as well, correct?

14 A. There's a spring as well.

15 Q. And I'll point these out. I think they are
16 pretty obvious.

17 So here's the spring.

18 A. Yes.

19 Q. And then there is what BD calls the inner hub,
20 correct?

21 A. That's BD's term, yes.

22 Q. And there's what BD calls the outer hub,
23 correct?

24 A. That's correct.

25 And you can also see the white adhesive that

1 we have been referring to a number of times. There you
2 can see the adhesive.

3 Q. Now, there's a -- the inner and outer hubs of
4 the Integra syringe fit together with a snap lock,
5 correct?

6 A. Well, it's a snap fit. People can debate for
7 a long time about whether it's snap lock, because you
8 can pop it out. But I agree that it snaps in place,
9 sets against the spring, and that's where that little
10 boing-boing effect happens.

11 Q. Okay. Do you agree that it's a snap lock?

12 A. At any given time, you can refer to something
13 as a snap fit or a snap lock. It is not a term of art.
14 Some people could call it snap lock. I could call it a
15 snap lock.

16 The point is it goes in there and it's not
17 friction-based.

18 Q. Mr. Sheehan, you gave a deposition in this
19 case; is that right?

20 A. Yeah.

21 Q. Okay.

22 MS. PIROZZOLO: Dennis, could you display
23 the video from Page 59, Lines 10 to 13 of Mr. Sheehan's
24 deposition?

25 (Video playing.)

1 QUESTION: And how do the inner and outer
2 hubs on the 3mL Integra fit together?

3 ANSWER: Oh, that's -- actually, it is
4 a -- there's a perfect example of -- of -- of sort of a
5 snap lock.

6 (End of video clip.)

7 Q. (By Ms. Pirozzolo) Was that your testimony,
8 sir?

9 A. Yes. And -- and it's consistent with what I
10 just said. On any given day, you can call it a snap
11 lock or a snap fit as long as what you understand is
12 that it's a mechanical fit and not a friction fit.

13 Q. So that's a mechanical hold, correct?

14 A. Yes.

15 Q. And the snap lock --

16 A. I'm sorry. Just to be clear, the relationship
17 between the -- what you call the inner hub and the outer
18 hub, that is a snap fit or a snap lock, whatever you
19 want.

20 Q. Okay. So the relationship between the inner
21 hub and outer hub is not a frictional hold, correct?

22 A. Correct.

23 Q. And the asserted RTI patents don't disclose a
24 needle assembly with an inner and outer hub that snap
25 together, correct?

1 A. That's correct.

2 Q. Now, the outer hub of the Integra 3mL syringe
3 has what you call threads, correct?

4 A. Oh, yeah -- yes. That portion -- what you
5 call the outer hub and what I call the second part of
6 the barrel has threads on the outside.

7 MS. PIROZZOLO: And could we put up
8 Defendant's Exhibit 312, No. 96?

9 Q. (By Ms. Pirozzolo) And you can see those
10 threads in this exhibit, correct?

11 A. Yes, ma'am.

12 Q. Okay. And the outer hub attaches to the
13 barrel by those threads, correct?

14 A. It is -- it is -- well, it's, generally
15 speaking, attached. I mean, it's the threads that guide
16 it in to begin with, sure.

17 Q. Okay. Because there are threads that mate
18 with -- there are threads on the barrel that mate with
19 the threads on the outer hub, correct?

20 A. Precisely.

21 Q. Now, earlier today, you talked about
22 frictional forces that are present when those two pieces
23 are put together; is that right?

24 A. That is correct.

25 Q. Okay. There's also a mechanical element to

1 that connection, correct?

2 A. There is a modest mechanical element to that
3 connection.

4 Q. The threads fit together like a metal nut and
5 a bolt screwed together, correct?

6 A. Generally speaking, when threads go together,
7 like I explained earlier, if it's like a metal one, you
8 know, it leads it in. But, eventually, when you tighten
9 it down, you get some distortion.

10 On Luer threads, which these are not, you get
11 a more distortion. These threads, although Luer-ish in
12 nature, are a little bit more substantial. So I would
13 expect less distortion. But it is true that you are
14 going to, at the end of the day, have some distortion
15 which will contribute a mechanical component as well.

16 Q. Mr. Sheehan, my question was, is it like a
17 metal nut and a bolt screwed together?

18 A. It depends in what -- in what capacity. It's
19 unlike it, because it's not metal. It's unlike it,
20 because it doesn't bend the threads the way a metal
21 thing goes.

22 So I'm afraid -- I'm not trying to be
23 difficult. I want to be able to answer the question
24 fairly.

25 Q. Okay. Let me just refer to your deposition.

1 A. Sure.

2 MS. PIROZZOLO: Dennis, could you put up
3 Page 61 of Mr. Sheehan's deposition, Lines 10 to 11?

4 (Video playing without audio.)

5 Q. (By Ms. Pirozzolo) Mr. Sheehan, you were
6 discussing the threads in the Integra 3mL syringe, and
7 you said just the way that system works.

8 Was that a true statement?

9 A. Can I see the whole thing?

10 Q. Sure.

11 A. I don't know what the context is.

12 If I take your word for it that you're
13 referring -- that I'm referring to the 3mL Integra
14 syringe, then that is true.

15 So I'm -- I'm saying that you get a little bit
16 of distortion, just like you do in metal nuts and bolts
17 but not nearly as much.

18 Q. Now, the patents don't disclose threads as a
19 frictional hold, correct?

20 A. The patents -- no.

21 Q. And you've never seen threads called a
22 frictional hold in any textbook, correct?

23 A. Generally speaking, that's not how they're
24 characterized, no. But -- okay. I just answered your
25 question.

1 Q. And you've never seen threads characterized as
2 a frictional hold in a trade journal, correct?

3 A. That's correct.

4 Q. Now, in the Integra, there's a two-piece
5 plunger, correct?

6 A. Oh, it's about four pieces actually.
7 Oh, which Integra?

8 Q. I'm talking about the Integra 3mL.

9 MS. PIROZZOLO: Let's put up Defendant's
10 Exhibit 312, No. 86, please.

11 Q. (By Ms. Pirozzolo) Is that a picture of the
12 plunger from the 3mL Integra?

13 A. Yes, ma'am.

14 MS. PIROZZOLO: Can we put up Exhibit --
15 Defendant's Exhibit 312, No. 62?

16 Q. (By Ms. Pirozzolo) Now, the plunger consists
17 of an inner plunger rod here, correct?

18 A. Yes, that's BD's term for it.

19 Q. And an outer plunger right here, correct?

20 A. I don't think it's called rod. I think it's
21 just called the outer plunger.

22 Q. Okay. It's the outer plunger; is that right?

23 A. Yes, ma'am.

24 Q. Okay. And the inner plunger rod has a cutter
25 on the end of it, correct?

1 A. Yes, press-fit on the end of it is the cutter.

2 Q. Okay. And the inner plunger rod snaps into
3 the outer plunger, correct?

4 A. Yes. That's a perfectly good definition
5 there. It snaps in just much like the other parts we're
6 talking about. That's fine. Sure.

7 Q. And that's a mechanical hold, correct?

8 A. Sure.

9 Q. Now, I want to focus on what happens when the
10 needle in the 3mL Integra syringe is retracted, okay?

11 A. Sure.

12 Q. And in particular whether there's any release
13 of any frictional force or clamping, okay?

14 Now, in the Integra, when the plunger is fully
15 depressed at the end of an injection, the cutter cuts
16 through the seal at the end of the plunger, correct?

17 A. I'm sorry. I was waiting for a picture. Say
18 it again.

19 Q. In the Integra, when the plunger is fully
20 depressed at the end of an injection, the cutter cuts
21 through the seal at the end of the plunger, correct?

22 A. In the 3ml?

23 Q. Yes.

24 A. Yes.

25 Q. Okay.

1 MS. PIROZZOLO: And if we can put up -- I
2 do have a picture -- Defendant's 312, No. 67.

3 Sorry for the delay.

4 Q. (By Ms. Pirozzolo) All right. Now, this
5 shows, does it not, Mr. Sheehan, the cutter cutting
6 through the end of the plunger seal?

7 A. Yes. You don't represent this to be actually
8 something working. You just artificially set this up
9 that you push the cutter through the -- through the
10 front of the plunger.

11 Q. Yes. So that the jury can see how the -- the
12 cutter comes right through the black part, the plunger
13 seal at the end of the plunger.

14 A. Oh, sure. Absolutely, it does. Sure.

15 Q. And after that happens, the spring propels the
16 needle back into the plunger, correct?

17 A. Well, it -- it emerges from there, and then
18 cuts through the bridging portion releasing the
19 needle-holder from the clamping or frictional hold.

20 Q. It cuts through this green piece of the inner
21 hub, correct?

22 A. Well, it cuts through the bridging portion of
23 that light piece, which you call the inner hub, which
24 is, in fact, the retainer member and the needle-holder.

25 Q. Okay. Now, is your Integra 3mL that you have,

1 has that been retracted?

2 A. This one? No.

3 Q. Okay. Could you retract the -- could you pull
4 it and activate the retraction mechanism?

5 A. Sure. Do you want me to leave the cap on or
6 off?

7 Q. You can leave it on so no one gets hurt.

8 A. (Complies.)

9 Q. Okay. Now, after you've retracted the Integra
10 3mL syringe, there's no release of any holding force
11 with the frictional threads, correct -- with the threads
12 between the needle assembly and the barrel, correct?

13 A. No. Those are part of the non-retractable
14 portion of the retainer.

15 Q. Okay. They didn't move at all during
16 retraction, correct?

17 A. No.

18 Q. So any friction you say was present in the
19 threads was not released, correct?

20 A. Whether -- it was released from holding the
21 needle-holder, because the bridge was cut.

22 Q. Okay. Well, you said that the frictional
23 forces are between the mating threads, correct?

24 A. Correct. I said friction is how the threads
25 hold down and -- and clamp the retainer.

1 Q. Okay. And those haven't moved once you
2 retract the syringe, correct?

3 A. That's correct.

4 Q. Now, you also talked on your direct about
5 clamping force in the Integra 3mL syringe, correct?

6 A. Yes, ma'am.

7 Q. Okay. And you said the -- I guess -- you said
8 the asserted patents saying the needle can be held in a
9 projecting position by clamping force, correct?

10 A. I just read the Court's instruction, if that's
11 what you're referring to.

12 Q. And you identified clamping in what you say is
13 clamping in the 3mL Integra syringe, correct?

14 A. Oh, absolutely. Yes, ma'am.

15 Q. Okay. And you say that there's some play
16 between the inner hub and the outer -- and the
17 needle-holder, correct?

18 A. There is some play -- oh, I can't use that one
19 now.

20 There is some play between what BD refers to
21 as the inner hub and the outer hub. That's the names on
22 the drawings. For me, there's some play between the
23 retainer member, bridging portion needle-holder object,
24 and the final part of the barrel that closes off the
25 barrel.

1 You need two pieces to close off -- sorry --
2 to close off this barrel. And, yes, there's a little
3 bit of play there evidencing the presence of the spring.

4 Q. Okay. And we have a large model of an Integra
5 syringe.

6 A. Oh, I guess so.

7 MS. PIROZZOLO: And if I may, Your Honor.

8 THE COURT: Yes. Yes.

9 Q. (By Ms. Pirozzolo) Are you talking about this
10 plate?

11 A. I'm going to cover this needle now before I
12 continue.

13 Q. Let me go through. So this is a spring of the
14 Integra syringe, correct?

15 A. Yeah. I'd have to see it more closely to --

16 THE COURT: Do want to step down?

17 THE WITNESS: Oh, yeah. Sure. Sorry.

18 THE COURT: Do you have a hand mic so you
19 can hear everyone?

20 THE WITNESS: I can be pretty loud.
21 Testing.

22 Q. (By Ms. Pirozzolo) This is the spring,
23 correct?

24 A. That's a spring, yes.

25 Q. Okay. This is the needle?

1 A. Okay.

2 Q. This is the inner hub, correct?

3 A. Well, it certainly looks like the inner hub.

4 Q. It's a model. Yeah.

5 A. Well, it certainly looks like you've got some
6 play in there. Because these are sectioned, they're not
7 going to behave like the actual round objects, so -- so
8 you could be misled.

9 But -- but, yeah, there's some boing-boing
10 because this can move up and down until it's clamped.

11 Q. And that's what you're talking about as the
12 play, the thing gets clamped into the barrel; is that
13 right?

14 A. Yeah. I called it boing-boing.

15 MS. PIROZZOLO: Mr. Beck, can you help me
16 with the barrel?

17 THE WITNESS: Oh, am I back?

18 MS. PIROZZOLO: Yes.

19 THE COURT: Mr. Hardin, if you like, you
20 can move around so you can see better.

21 MR. HARDIN: Thank you, Your Honor.

22 Q. (By Ms. Pirozzolo) And just so you can see,
23 you say the clamping occurs between the outer part of
24 the assembly, correct? And the inner part of the barrel
25 here (indicates)?

1 A. Well, remember, I'm calling this as the second
2 part of the barrel. So what happens is --

3 THE COURT: Can y'all please speak up.
4 Both the reporter and I are having trouble hearing.

5 THE WITNESS: I'm sorry. I'm holding the
6 mic off.

7 THE COURT: I understand.

8 THE WITNESS: Sorry.

9 A. Okay. What happens is that the orangy part,
10 as it gets threaded in by the threads in the blue part,
11 will eventually clamp down, close the spring to its
12 final height and push the white part, which is the
13 retainer member, which is then connected to the bridging
14 portion and the needle-holder, against this sloping
15 surface on the -- the other part of the barrel.

16 Q. So the needle-holder is being clamped between
17 the barrel and the orange part, correct?

18 A. Well, the needle-holder is connected to the
19 bridging portion, which is connected to the retainer
20 member, which is being clamped between the two parts of
21 the barrel.

22 Q. Thank you.

23 Now, that clamping force that we just looked
24 at is not between the retainer member and the wall of
25 the barrel, correct?

1 A. Retainer member and the wall of the barrel?

2 Well, sure. It's -- it's an outer surface of the
3 barrel. I mean, it's a -- it's a -- that sloping
4 portion. If what you say -- if what you mean to say
5 it's not the long part of the barrel, sure, it's not.
6 It's this canted, sloped surface where you hope to get a
7 seal.

8 Q. Okay. Now, when you unscrew the needle
9 assembly from the Integra syringe, the needle is in a
10 projecting position, correct?

11 A. You mean I haven't used it yet?

12 Q. Yes.

13 A. I mean, it came assembled and I'm, for some
14 reason, disassembling it?

15 Q. Yes. The needle is in a projecting position,
16 correct?

17 A. No. I mean -- sure, it's sticking up, but
18 it's not attached to a syringe, so it's kind of
19 irrelevant. And the spring pops it back, and so it's
20 kind of wobbling a little bit. So I'm not sure it's
21 important.

22 Q. If I take off the cover of the needle --

23 A. Sure.

24 Q. -- so I have the needle setting here, correct?
25 It's projecting now, correct?

1 A. Okay. Yeah.

2 Q. It's projecting?

3 A. Right.

4 Q. If I unscrew it from the barrel, it's still
5 projecting, correct?

6 A. No. It actually dropped back.

7 Q. Okay. Because of the little play?

8 A. Yeah, the boing-boing.

9 Q. Okay. Now, during retraction -- the needle in
10 the Integra 3mL, during the retraction process, the
11 cutter slices through the inner hub, correct?

12 A. The cutter slices through the bridging portion
13 between the needle-holder and the retainer member that
14 being what BD describes in their engineering drawings as
15 the inner hub.

16 Q. Okay. And when the inner hub is -- when the
17 portion you just described is cut, the retainer ring is
18 still there, correct?

19 A. The retainer member? Is that what you mean?

20 Q. Yes.

21 A. You said retainer ring.

22 Q. Yes.

23 A. Yes, it's still there.

24 Q. And, in fact, it hasn't moved at all, correct?

25 A. Hasn't moved at all.

1 Q. Okay. So I want to look at one of your
2 animations.

3 MS. PIROZZOLO: Could we put up --

4 THE WITNESS: Sure.

5 MS. PIROZZOLO: The animation?

6 (Animation playing.)

7 Q. (By Ms. Pirozzolo) Now, this -- this animation
8 you prepared to show the 3mL Integra, correct?

9 A. Yes, ma'am.

10 Q. Okay. And the outer hub is in green, correct?

11 A. What I call -- what is -- what is defined --
12 the far end of the barrel.

13 Q. Okay. And this inner portion is the
14 needle-holder, correct?

15 A. Well, the middle part of that is the
16 needle-holder.

17 Q. Okay. And this portion here (indicates) is
18 what you call the retainer member, correct?

19 A. Yes. That's part of the non-retractable
20 portion.

21 Q. Okay. Now, when retraction occurs --

22 MS. PIROZZOLO: Why don't we run the
23 clip.

24 (Animation playing.)

25 Q. (By Ms. Pirozzolo) So the portion you call the

1 retainer member is setting in the same place, correct?

2 A. Right. It's the non-retractable portion.

3 Q. Okay. But the clamping force that you talked
4 about that's holding the retainer member between the
5 canted part of the barrel and the green portion of the
6 syringe, that hasn't moved at all, correct?

7 A. No, that hasn't changed. No.

8 Q. So that clamping force is exactly the same as
9 it was before retraction, correct?

10 A. The total amount of the force and where it's
11 clamping, sure. But, of course, it's been disconnected
12 from the needle-holder.

13 Q. The retainer member hasn't moved at all,
14 correct?

15 A. That's correct.

16 Q. Now, let's look at Claim 10 of the '077
17 patent.

18 MS. PIROZZOLO: Actually, could we go
19 back to the -- to the animation? I just have one more
20 question.

21 Q. (By Ms. Pirozzolo) Now, you said the retainer
22 member hasn't moved at all, correct?

23 A. Yeah, I agreed with you, sure.

24 Q. Now, I think we agreed that part of the
25 Court's claim construction required that the clamping or

1 frictional force be released, correct?

2 A. Yeah. Let's look at it. Do you have the tab?

3 MS. PIROZZOLO: We can put the definition
4 up.

5 I believe it's right at the back of your
6 binder.

7 THE COURT: Tab 4 of the jury notebook, I
8 believe.

9 THE WITNESS: Thank you. I would rather
10 look at the Court.

11 Q. Okay. So the clamping --

12 MS. PIROZZOLO: Why don't we go back to
13 the animation while --

14 (Animation playing.)

15 Q. (By Ms. Pirozzolo) So the clamping -- you
16 agree that the clamping or frictional force has to be
17 released, correct?

18 A. I agree with the Court's construction that a
19 non -- that a retainer member is a non-retractable part
20 of the retraction mechanism. So that's all that stuff
21 that doesn't retract.

22 That uses some clamping or frictional force to
23 keep the needle in the projecting position. And that's
24 what it's doing before you cut it until that clamping or
25 frictional force is released. And it is released by

1 virtue of cutting, because now it is no longer -- the
2 needle can no longer be held in the projecting position.
3 And that's exactly what just happened.

4 Q. But the clamping or frictional force
5 holding the retainer member hasn't been released,
6 correct?

7 A. It hasn't disappeared, but it has been
8 released from the needle-holder.

9 Q. But the clamping between the canted part of
10 the barrel and the green portion of the syringe is still
11 setting there, correct?

12 A. Yeah. Once again, it has not disappeared.

13 Q. All right. Let's look at Claim 10 of the '077
14 patent.

15 Now, we -- Claim 10 of the '077 patent
16 requires a vent in fluid communication with a retraction
17 cavity to allow airflow from the retraction cavity,
18 correct?

19 A. I'll take your word for it. It looks like it.
20 Right.

21 Q. We talked about the plunger in the Integra
22 earlier, correct?

23 A. We did, yeah. Sure.

24 Q. Okay. And the Integra 3mL syringe has holes
25 in the inner plunger rod, right?

1 A. Yes, two, one on each side.

2 Q. And you've given the opinion that those holes
3 are vents, correct?

4 A. I have.

5 Q. According to the claim, the vent is to allow
6 airflow from the retraction cavity, correct?

7 A. That's correct.

8 Q. And you agree that in the Integra 3mL syringe,
9 the inner plunger rod fits into the outer plunger rod,
10 correct?

11 A. I'm sorry. I had to pull up the Court's
12 construction of vent.

13 Q. Uh-huh.

14 A. So could you repeat the question?

15 Q. Would the plunger in the Integra syringe, the
16 inner rod -- the inner plunger fits into the outer
17 plunger, right?

18 A. Sure. It fits inside of it, but it's got
19 space.

20 Q. Okay. And in that configuration, the holes in
21 the inner plunger rod are obscured, correct?

22 A. There -- may be visually obscured, but they're
23 certainly not blocked.

24 Q. But they're obscured by the outer plunger rod,
25 correct?

1 A. In fairness to me, when you say obscured, do
2 you mean blocked or cannot be seen?

3 Q. Well, let's look at what you said in your
4 deposition, Mr. Sheehan.

5 And in particular on Page 18 -- 118, Lines 15
6 through 19, you were asked: And those holes are covered
7 by the outer plunger rod when the plunger is assembled;
8 is that correct?

9 And you said: They are obscured.

10 Was that correct?

11 A. Well, yeah. That little snippet is correct,
12 meaning you can't see them. You're -- you're -- I
13 mean -- well, you can actually see them, if you look
14 carefully, but they are obscured, because they're --
15 they're just hidden, is all.

16 Q. You never did any testing, Mr. Sheehan, to see
17 if air passes out of the holes in the Integra inner
18 plunger rod and out of the retraction cavity, correct?

19 A. That's correct.

20 Q. You agree that Claim 10 of the '077 patent
21 doesn't refer to splatter, correct?

22 A. Oh, the claim doesn't, no. The specification
23 discusses it, sure.

24 Q. But the claim does not refer to splatter,
25 correct?

1 A. That's correct.

2 Q. Okay. And you didn't do any test to determine
3 whether the holes in the Integra 3mL syringe reduce
4 splatter out of the nose of this syringe, correct?

5 A. That's correct.

6 Q. Now, Mr. Shaw's patent -- and I want to go to
7 Column 15, Lines 47 through 52 -- says that one
8 advantage of the vent design is that they're designed
9 for ease of molding, since they can -- I think it means
10 be formed in the mold that makes the plunger without
11 using separate pins to form an opening, correct?

12 A. Yes. He's addressing what people -- folks
13 know who do molding, about how you can get some vent
14 paths without having to use core pins or slides.
15 These are things that come in from the side. Most molds
16 open like this (indicates), and you don't want to have
17 slides that makes it more complicated. So this is just
18 Mr. Shaw pointing out, hey, here's how you can mold
19 these.

20 Q. You don't have to use core pins, correct?

21 A. No. No. You -- you don't have to use core
22 pins, although you have to, in this case, put a cap in
23 the back. But of course not.

24 Q. You understand that the holes in the
25 Integra -- the plunger of the Integra syringe are core

1 pin holes, correct?

2 A. You know, it's my understanding that -- now,
3 are we in the 3ml or the 1ml?

4 Q. The 3ml.

5 A. Okay. Well, if we're still in the 3ml, it is
6 my understanding that it's been alleged that that's
7 what they're -- what they're there for. And I have no
8 problem with that.

9 Sure -- they're not necessary. I mean, you
10 can mold that plunger without having those core pins
11 there. It's been alleged that those core pins are there
12 to stable -- those holes are there to stabilize the core
13 pin, but they're not necessary.

14 So I believe they're there to be vents.

15 Q. You agree that they're core -- they're made by
16 core pins, correct?

17 A. Well, they're not core pins; they're actually
18 made by slides. The core pin is the large pin that goes
19 down the middle. That's the core pin. It goes down the
20 core. And those are two little slides that come in from
21 the slide.

22 Q. Now, I want to turn to Page 119 of your
23 deposition, please.

24 MR. HARDIN: Your Honor, unless there's a
25 question, there's no reason to look at the deposition.

1 THE COURT: Do you have a question?

2 MS. PIROZZOLO: I will.

3 THE COURT: Very well. We'll have a
4 question.

5 Q. (By Ms. Pirozzolo) Mr. Sheehan, at -- your
6 deposition was you giving testimony under oath, correct?

7 A. Yes, sure.

8 Q. Just like here -- just like here in court here
9 today?

10 A. Yes. Always my intention. That's -- I tell
11 the truth.

12 Q. Okay. Now, let's look at Page 119 of your
13 deposition, and in particular, Lines 20 through 24.
14 And you were asked: Why are the holes in the Integra
15 plunger; do you know?

16 And you stated: Well, I am informed that BD
17 asserts that they are there because they were used to
18 support as core pin supports, which was entirely
19 possible.

20 A. Sure.

21 Q. Was that a true statement?

22 A. Yeah, absolutely. It's consistent with what I
23 just said.

24 Q. Now, let's turn to the Integra 1mL syringe.
25 There are three claims of the '733 patent being asserted

1 against the 1ml syringe, correct?

2 A. Oh, I'm sorry. I was getting my 1ml out.

3 There are how many claims?

4 Q. There are -- actually, there are two claims, I
5 think, from the '733 patent being asserted against the
6 Integra 1mL syringe, correct?

7 A. That's correct.

8 Q. Okay. And all of those claims require that
9 the retraction mechanism be in the nose of the syringe,
10 correct?

11 A. Oh, gosh, I'd love to look at the claims to be
12 sure.

13 Q. Okay.

14 MS. PIROZZOLO: Well, let's put up the
15 claim construction order, Page 28.

16 A. Oh.

17 MS. PIROZZOLO: And in particular, the
18 definition of nose.

19 Q. (By Ms. Pirozzolo) The nose is the portion of
20 the syringe at the injection end that has a reduced
21 diameter relative to the barrel, correct?

22 A. I'm sorry. I really don't mean to be rude,
23 but you asked me a question, and I said could I see the
24 claim.

25 Q. Okay.

1 A. You asked me whether or not nose appeared in
2 whatever claims there were, and I just wanted to see the
3 claims to verify that.

4 Q. Okay.

5 A. If you are willing to aver that they're there,
6 I'll take your word for it, but in fairness to the folks
7 here, I wanted to look at it and be sure.

8 Q. Okay. Do you need to look at the claims of
9 those patents to know whether or not the retraction
10 mechanism has to be in the nose?

11 A. Take 30 seconds.

12 Q. Okay. Go. Please go ahead.

13 THE COURT: While he's taking that 30
14 seconds, how much more cross-examination do you
15 anticipate?

16 MS. PIROZZOLO: I think I have at least a
17 half an hour, Your Honor.

18 THE COURT: Counsel, the jury would
19 probably like to leave at 5:00; is that correct?

20 JUROR: Now.

21 [Laughter]

22 THE COURT: Why don't we go about
23 another -- what was that statement? Now?

24 Why don't we go about another 10 minutes
25 or at a convenient breaking point close by, and we'll

1 let the jury go for the day.

2 MS. PIROZZOLO: I'll finish up with the
3 nose, and we can stop.

4 A. Are you in the '733?

5 Q. (By Ms. Pirozzolo) Yes.

6 A. Okey-doke.

7 Q. And just to be clear, I'm asking you about the
8 claims that you were discussing on your direct
9 testimony.

10 A. Right, which is '733, Claims 1 and 24.

11 Q. Right.

12 A. Okay. 1 and 24. Yes.

13 Q. Okay. And those claims require that the
14 retraction mechanism be in the nose of the syringe,
15 correct?

16 A. Yes, ma'am.

17 Q. Okay. And the Court defined nose as the
18 portion of the syringe at the injection end that has a
19 reduced diameter relative to the barrel, correct?

20 A. Yes, ma'am.

21 Q. Okay. And the Court also defined transition
22 zone as the portion of the syringe located between the
23 barrel and the nose, correct?

24 A. Yes, ma'am.

25 MS. PIROZZOLO: Now I want to put up

1 Defendant's Exhibit 311, No. 33, which is a picture of
2 the 1ml Integra syringe.

3 Whoop, that doesn't look like the right
4 picture. Perhaps we can go to Defendant's Exhibit 183.

5 Q. (By Ms. Pirozzolo) I guess now we have a
6 picture. Is that a picture, Mr. Sheehan, of the Integra
7 1mL syringe?

8 A. Looks like one of them.

9 Q. Now, you have defined nose as starting where I
10 have my pointer and going forward towards the needle,
11 correct?

12 A. In fairness to me and everyone present, when
13 you say there, you're pointing to some -- a feature on
14 the outside, and we have to look at the inside.

15 Q. Okay. Well, let me -- let me be -- try to --
16 I think this is fairly clear.

17 You know BD's expert, Dr. Sibbitt, says the
18 portion right at the front of the syringe, the narrowest
19 portion of the syringe, is the nose, correct?

20 A. I believe I read that, sure.

21 Q. Okay. And you don't agree with that, correct?

22 A. No, I don't.

23 Q. Okay. You think this -- some portion of this
24 part of the syringe is also the nose of the syringe,
25 correct?

1 A. I think the nose is exactly where I described
2 it before, and I'll do it again, if you'd like.

3 Q. Okay. Well, let's go to the animation that
4 you prepared to show the nose. This is your animation,
5 correct?

6 A. So far, it looks like it, yes.

7 Q. And you're saying that the nose includes this
8 entire part of the syringe in green (indicating),
9 correct?

10 A. The green part, correct.

11 Q. Okay. And the transition zone is this thin
12 line right here (indicates); is that right?

13 A. Well, it's not a line. It has some width.
14 And that's the transition zone between the barrel and
15 the nose, according to the Court's claim construction.

16 Q. Okay. And you say the transition zone is an
17 area that's approximately 5 to 6,000ths of an inch long,
18 correct?

19 A. In this particular 1ml syringe, yes. It's
20 about that long.

21 Q. Okay. Now, if Dr. Sibbitt's right and the
22 nose is just the front narrowest portion of the syringe,
23 then you would agree that the retraction mechanism is
24 not in that portion of the syringe, correct?

25 A. Oh, sure. No problem.

1 Q. Okay. You have to have the nose go all the
2 way back to where you have it in order to be able to
3 offer the opinion that the retraction mechanism is in
4 the nose of the syringe, correct?

5 A. I don't have to have it back there. That's
6 where it is. That's the definition. The transition
7 zone follows from the barrel. Sorry.

8 Q. But if you said this part where the syringe
9 narrows was the transition zone, then the retraction
10 mechanism would not be in the nose, correct?

11 A. Yes, that's correct.

12 MS. PIROZZOLO: Okay. I have no -- we
13 can stop here, if that's --

14 THE COURT: This is a convenient stopping
15 point?

16 Ladies and Gentlemen of the Jury, we'll
17 allow you to go for the day. Just recall my previous
18 instructions not to discuss this case, not to
19 investigate this case in any fashion.

```
20         And we'll see you tomorrow morning.  Try
21 to start promptly at 9:00 a.m.  Have a nice evening.
```

22 COURT SECURITY OFFICER: All rise.

23 | (Jury out.)

24 THE COURT: Have a seat, everyone.

25 | Mr. Bowles, I told you Friday afternoon

1 that sounded awfully ambitious, what you had in mind for
2 the day.

3 MR. BOWLES: Well, you know, that
4 wouldn't be the first time, Your Honor.

5 THE COURT: So we have 30 minutes more of
6 cross and then some redirect, and then what can we
7 expect tomorrow?

8 MR. BOWLES: Tomorrow, after --

9 THE COURT: We'll cut in half whatever
10 you say.

11 MR. BOWLES: -- after Mr. Sheehan --
12 after Mr. Sheehan, we're going to have some videos of
13 engineers, and we'd like --

14 THE COURT: About how long will the
15 deposition cuts last?

16 MR. BOWLES: Half an hour total.
17 And we would like a minute or two just to introduce the
18 engineers in part of our transition.

19 Then after that, we'll have Mr. Shaw.

20 THE COURT: Oh, the introduction is part
21 of your 12 and a half hours.

22 MR. BOWLES: Oh, okay, whatever the Court
23 says.

24 And then we'll have --

25 THE COURT: You mean naming the witness

1 or trying to sort of tell them what their anticipated
2 testimony is going to be? I don't know if I quite
3 understand what you're saying.

4 MR. BOWLES: Well, just to explain to the
5 jury who the people are that are going to be testifying.

6 THE COURT: I guess, in fairness, that
7 would come from your 30 minutes.

8 MR. BOWLES: Thank you.

9 And then we will have Mr. Shaw. Then we
10 will have about 35 minutes of three BD witnesses by
11 deposition. Then we'll have Mr. Bratic.

12 And then we have asked -- we intend to
13 call Mr. Kozy as our last witness, adverse. And he is
14 the corporate representative of BD, and then we're going
15 to rest.

16 MR. CARROLL: And we'll read some
17 stipulations.

18 MR. BOWLES: And we will read some
19 stipulations.

20 THE COURT: I'm guessing we won't do all
21 this tomorrow, but --

22 MR. BOWLES: We will do our best.

23 THE COURT: -- anyway, we'll see.

24 Now, where are the parties on the
25 instructions that you were trying to agree upon? I just

1 wanted to know where we are and when we're going to need
2 them.

3 MR. DAWSON: Your Honor, we have agreed
4 on three of them, I believe, but the fourth we need
5 to --

6 THE COURT: We're still --

7 MR. DAWSON: -- visit with Mr. Hardin.

8 THE COURT: We're still tweaking on the
9 fourth.

10 Which three have we agreed upon?

11 MR. HARDIN: Well, Your Honor, I believe
12 we've agreed on the one that relates to the specific
13 document, Exhibit 13, and obviously, that one, we think,
14 ought to be used if and when Exhibit 13 is used.

15 THE COURT: Is that the letter that
16 received a lot of people --

17 MR. HARDIN: Yes, that is the letter,
18 yes.

19 THE COURT: -- received, the 408 --

20 MR. HARDIN: I've got two copies.

21 THE COURT: Do you have a -- do we have a
22 copy of those, Counselor?

23 MR. DAWSON: We have submitted to you the
24 language on the three that we've agreed to, and with the
25 Court's permission, we'd like to speak with RTI tonight

1 and see if we can come up with some language on the
2 fourth, and if so, we'll submit it in the morning.

3 THE COURT: What do the parties suggest?
4 As those may be read, then later include them in the
5 jury notebook or --

6 MR. DAWSON: Our position is, Judge, that
7 these ought not to be read until the conclusion of the
8 case and that we don't need to read it every time
9 there's a specific objection.

10 It's our position the Court will be
11 instructing the jury at the conclusion of the case with
12 all of your instructions, and to the extent that any of
13 these are appropriate, we believe would be appropriate
14 at the conclusion of the case.

15 MR. HARDIN: And we think the exact
16 opposite, Your Honor.

17 THE COURT: And that's -- the exact
18 opposite is normally my practice.

19 MR. HARDIN: We think they ought to be in
20 the --

21 MR. DAWSON: I probably should have known
22 that before I read that. And we don't think -- we don't
23 think they --

24 THE COURT: I think to do it otherwise,
25 the jury is not going to know what you're instructing

1 them on.

2 So it's been my practice -- and the
3 parties are going to have to request the instruction,
4 but I'm going to give it prior to that testimony or in
5 some fashion when the testimony is being given or the
6 exhibit's being referred to. I think it means more to
7 the jury at that stage.

8 MR. HARDIN: And as I know we're trying
9 to be economical in time, could I suggest that we give
10 these -- the parties agree on some short caption for
11 this, so that when we ask the Court for the
12 instructions, you can --

13 THE COURT: Why don't we just number
14 them?

15 MR. HARDIN: That will be fine. That
16 will be fine.

17 THE COURT: That's all the caption we
18 need.

19 MR. HARDIN: That's fine. That's fine.
20 I've got 1, 2, 3, 4 on mine already.

21 THE COURT: Otherwise, they -- as
22 reasonable as you gentlemen are, you'll never agree upon
23 the caption.

24 So 1, 2, 3, and 4.

25 MR. HARDIN: We'll make sure the Court

1 understands what we think about 1, 2, 3, and 4, and
2 we'll try to work out ---

3 THE COURT: Surely, you can agree upon
4 that.

5 Anything else, housekeeping matters?

6 MR. DAWSON: We will have our stipulation
7 of withdrawing defenses for the Court first thing in the
8 morning before we start.

9 THE COURT: Just so we have that
10 somewhere in the record. I want --

11 MR. DAWSON: We've had somebody draft it.
12 I just haven't had a chance to look at it.

13 THE COURT: In the event the Federal
14 Circuit takes a look at this, we want them to know what
15 took place.

16 Anything else?

17 Very well. We'll try to -- my staff and
18 I will try to be promptly here at 8:30. So if you have
19 any -- I'm not encouraging any problems overnight, but
20 we'll be here at 8:30.

21 See everyone tomorrow.

22 COURT SECURITY OFFICER: All rise.

23 (Court adjourned.)
